Notes:

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	13 July 2016
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	21 March 2016
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

To assess the hepatic and renal safety of multiple dose administration of two dose levels of CSL112 (low dose [2 g] or high dose [6 g]) compared with placebo in subjects with acute myocardial infarction.

Protection of trial subjects:

Before undergoing screening procedures for possible enrollment into the study, subjects were informed, in an understandable form, about the nature, scope, and possible consequences of the study. The investigator was responsible for obtaining a subject's written informed consent to participate in the study. The investigator may cease study treatment and withdraw the subject, or the subject may withdraw himself from participation in the study at any time. In accordance with International Conference on Harmonisation principles of Good Clinical Practice, the Investigator always had the option to advise a subject to stop further administration of investigational product (IP) if the subject's safety or well-being was compromised by the continued administration of IP. Concern for the interests of the subject was always to prevail over the interests of the study. However, subjects were to continue to be followed for safety and the occurrence of Major Adverse Cardiovascular Events (MACE). At minimum, all efforts were to be made to confirm vital status if a subject was unwilling or unable to return for scheduled on-site visits or refused to be contacted by telephone for the MACE follow-up visits.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	15 August 2014
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Netherlands: 145
Country: Number of subjects enrolled	Poland: 204
Country: Number of subjects enrolled	Spain: 17
Country: Number of subjects enrolled	United Kingdom: 9
Country: Number of subjects enrolled	Austria: 7
Country: Number of subjects enrolled	Bulgaria: 140
Country: Number of subjects enrolled	Czech Republic: 104
Country: Number of subjects enrolled	Denmark: 28
Country: Number of subjects enrolled	France: 3
Country: Number of subjects enrolled	Germany: 86
Country: Number of subjects enrolled	Hungary: 202
Country: Number of subjects enrolled	Italy: 22
Country: Number of subjects enrolled	Australia: 18
Country: Number of subjects enrolled	Canada: 25

Country: Number of subjects enrolled	Israel: 81
Country: Number of subjects enrolled	United States: 167
Worldwide total number of subjects	1258
EEA total number of subjects	967

Notes:

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	903
From 65 to 84 years	350
85 years and over	5

Subject disposition

Recruitment

Recruitment details:

A safety lead-in was conducted before enrollment into the main study, and provided an early assessment of safety in subjects with acute myocardial infarction and mild renal impairment or normal renal function. Upon confirmation of safety in the lead-in, additional subjects were screened for enrollment in the main study.

Pre-assignment

Screening details:

A total of 11 subjects were screened for participation in the safety lead-in, and 9 subjects were enrolled. A total of 1401 subjects were screened for entry into the main study. Of these subjects, 143 subjects were screen failures, and the remaining 1258 eligible subjects were randomized.

Period 1

Period 1 title	Main Study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Investigator, Subject

Arms

Are arms mutually exclusive?	Yes
Arm title	CSL112 (2 g)

Arm description:

CSL112 (low dose) is to be administered as an intravenous (IV) infusion once weekly for 4 consecutive weeks.

Arm type	Experimental
Investigational medicinal product name	CSL112
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Powder for solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

CSL112 (low or high dose) is to be administered as an intravenous (IV) infusion once weekly for 4 consecutive weeks.

Arm title	CSL112 (6 g)
------------------	--------------

Arm description:

CSL112 (high dose) is to be administered as an IV infusion once weekly for 4 consecutive weeks.

Arm type	Experimental
Investigational medicinal product name	CSL112
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Powder for solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

CSL112 (low or high dose) is to be administered as an intravenous (IV) infusion once weekly for 4 consecutive weeks.

Arm title	Placebo
------------------	---------

Arm description:

Placebo is to be administered as an IV infusion at the same frequency, volume and duration as either the low dose or high dose CSL112 infusion.

Arm type	Placebo
----------	---------

Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection/infusion
Routes of administration	Intravenous use

Dosage and administration details:

Placebo (0.9% weight/volume sodium chloride solution (ie, normal saline) is to be administered as an IV infusion at the same frequency, volume and duration as either the low dose or high dose CSL112 infusion.

Number of subjects in period 1	CSL112 (2 g)	CSL112 (6 g)	Placebo
Started	419	421	418
Completed	375	379	376
Not completed	44	42	42
Adverse event, serious fatal	2	2	1
Physician decision	-	2	-
Patient did not want another infusion	3	3	2
Randomized by error/screen failure	-	1	-
Consent withdrawn by subject	7	3	4
Patient decision	7	9	14
Adverse event, non-fatal	11	6	12
Due to key hepatic values	1	-	-
Missed IV due to pharmacy error	-	1	-
Non-compliance	2	1	1
Vacation	1	-	-
Unable to contact patient	3	1	2
Patient unable to come to site/attend visit	6	11	6
Lost to follow-up	-	1	-
Distance to center	1	1	-

End points

End points reporting groups

Reporting group title	CSL112 (2 g)
Reporting group description: CSL112 (low dose) is to be administered as an intravenous (IV) infusion once weekly for 4 consecutive weeks.	
Reporting group title	CSL112 (6 g)
Reporting group description: CSL112 (high dose) is to be administered as an IV infusion once weekly for 4 consecutive weeks.	
Reporting group title	Placebo
Reporting group description: Placebo is to be administered as an IV infusion at the same frequency, volume and duration as either the low dose or high dose CSL112 infusion.	
Subject analysis set title	Safety population
Subject analysis set type	Safety analysis
Subject analysis set description: The Safety population comprised all subjects who were randomized into the main study or PK/PD substudy and received at least a partial infusion of the IP.	
Subject analysis set title	ITT population
Subject analysis set type	Intention-to-treat
Subject analysis set description: The Intent-to-Treat (ITT) population comprised all subjects who were randomized to one of the three treatment groups for the Main Study or PK/PD substudy.	
Subject analysis set title	Pharmacokinetic (PK) population
Subject analysis set type	Intention-to-treat
Subject analysis set description: The PK population comprised all subjects who received at least 1 infusion of IP and had at least 1 post baseline measurable plasma concentration of apoA-I or PC.	
Subject analysis set title	Pharmacokinetic/Pharmacodynamic (PK/PD) population
Subject analysis set type	Sub-group analysis
Subject analysis set description: The Pharmacokinetic/Pharmacodynamic (PK/PD) population was a subset of subjects from the main study who consented to participate in the PK/PD substudy.	
Subject analysis set title	Serology population
Subject analysis set type	Sub-group analysis
Subject analysis set description: A random subset of subjects was selected and had their samples tested for the presence of parvovirus B19.	

Primary: Percent of subjects with clinically important change in drug-induced liver injury (Safety population)

End point title	Percent of subjects with clinically important change in drug-induced liver injury (Safety population)
End point description: A clinically important change in drug-induced liver injury is defined as a change (from baseline) in alanine aminotransferase (ALT) greater than 3 times the upper limit of normal (ULN) or a change in total bilirubin greater than 2 times ULN, that is confirmed upon repeat measurement.	
End point type	Primary
End point timeframe: From baseline (before 1st infusion) to Day 29

Reporting groups

Reporting group title	Safety Lead-in [CSL112 (2 g)]
-----------------------	-------------------------------

Reporting group description:

In the safety lead-in, a small number of subjects (evenly stratified between subjects with normal renal function or mild renal impairment) were administered a single, 2 g infusion of CSL112.

Reporting group title	CSL112 (2 g)
-----------------------	--------------

Reporting group description:

CSL112 (low dose) was administered as an intravenous (IV) infusion once weekly for 4 consecutive weeks.

Reporting group title	CSL112 (6 g)
-----------------------	--------------

Reporting group description:

CSL112 (high dose) was administered as an IV infusion once weekly for 4 consecutive weeks.

Reporting group title	Placebo
-----------------------	---------

Reporting group description:

Placebo was administered as an IV infusion at the same frequency, volume and duration as either the low dose or high dose CSL112 infusion.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
20 December 2013	<ol style="list-style-type: none">1. A safety lead-in period was added to assess the safety and tolerability of CSL112 compared to placebo in subjects with acute myocardial infarction, with the requirement of safety data review by the Data Safety Monitoring Board from this lead-in period prior to enrolment of subjects into the main study. The safety lead-in period was added to this study to fulfill a request from FDA.2. A pharmacokinetic (PK)/pharmacodynamics (PD) substudy was added to the protocol with intense sampling to occur in approximately 48 subjects after doses 1 and 4, with only sparse PK/PD sampling of subjects to be included in the main study.3. New assessments were added to schedules for monitoring safety:<ol style="list-style-type: none">i. presence of hypovolemiaii. determination and review of serum creatinine and ALT values prior to dosingiii. drug hypersensitivity reactionsiv. urinalysisv. exploratory renal biomarkers (limited to PK/PD substudy only).4. The objectives of the study were modified and changes were made to the corresponding endpoints. The secondary objectives now include characterization of the safety and tolerability and the pharmacokinetics of CSL112 in subjects with acute myocardial infarction.5. The inclusion criterion defining eligibility restrictions for subjects who undergo angiography were modified, reducing the magnitude of allowable increases in serum creatinine post contrast agent administration. Further definition was also provided regarding the meaning of "significant" ST/T wave changes.6. Modifications/clarifications of and additional dose delay/dose stopping rules were added to the protocol with respect to confirming subject eligibility for initial and subsequent investigational product treatment based on serum creatinine values.
01 October 2014	<ol style="list-style-type: none">1. Assessment of bilirubin was included in criteria for determining stable hepatic function and levels were defined for dose delay/stopping rules in the main study.2. Serology and nucleic acid testing was revised to test only for the presence of parvovirus B19 instead of testing for 5 pathogens (ie, HIV 1/2, hepatitis A virus, hepatitis B virus, hepatitis C virus, and parvovirus B19) as originally planned.3. Inclusion of a new methods section and requirement of additional measurements (repeat assessment of hemoglobin level, serum haptoglobin levels, lactate dehydrogenase, total and direct bilirubin levels, including the calculation of indirect bilirubin, and urine hemosiderin) for assessment of hemolysis for any ≥ 2 g/dL decrease in hemoglobin not explained by overt blood loss.4. Parameters were set for the maximum duration between infusions (at least 7 days and no more than 10 days) and allowance for fewer than 4 infusions to be administered if the total duration from Study Day 1 would exceed 30 days (ie, discussed in text as "missed infusions").5. Drug-related adverse events (adverse reactions), changing the time window relative to infusion from within 72 hours to within 1 hour for classification and reporting requirements of adverse drug reactions that occur with an incidence $> 30\%$ of that of the placebo rate and that occur in at least 1% of subjects is redefined.

14 July 2015	<ol style="list-style-type: none"> 1. Allowed for screening and randomization to occur on the same day if specific criteria are met. 2. For screening and randomization occurring on the same day, allowed for a single blood draw to be performed at screening to collect two samples, one for local and one for central laboratory testing. 3. Decreased retention time for virology samples to 1 year from 5 years. 4. Further defined adverse events of special interest and added potential Hy's law and drug hypersensitivity reactions to the adverse event of special interest section. 5. Further defined the drug hypersensitivity reaction assessment. 6. Added collection of a standard of care serum creatinine value prior to administration of contrast agent. 7. Modified the secondary endpoint language for evaluation of adverse drug reactions. 8. Added the definition of first medical contact 9. In reviewing the available study data and the FDA-suggested guidelines and analyses for early dosing of investigational product following contrast administration, the DSMB assessed the safety of the investigational product when administered within 48 h from contrast administration and determined that earlier treatment could be initiated in the US cohort of patients. <p>The recommendation harmonized the US with all other sites and allowed the study to be conducted under a single global harmonized protocol (allowing administration of investigational product to be as early as 12 h after the index event or 12 h after the administration of IV contrast media once renal function is determined to be stable).</p>

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

This study was not designed to test for efficacy and was underpowered to assess efficacy. The overall number of MACE was low and the number of subjects with complete follow-up through 1 year was also low (89 of 1258 subjects; 7.1%).

Notes:
