

Clinical trial results:

Can Vitamin D supplementation improve Hepatitis C cure rates: A pilot multicentre randomised controlled clinical trial

Summary

EudraCT number	2013-003573-10
Trial protocol	GB
Global end of trial date	22 December 2015

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	05 December 2016
Is this the analysis of the primary completion data?	Yes
Primary completion date	22 December 2015
Global end of trial reached?	Yes
Global end of trial date	22 December 2015
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The primary objective is to test if vitamin D supplementation improves the chances of standard treatment for HCV infection being effective. To test this we will measure if there is an improvement in the virologic response - ie the level of virus in the blood, 12 weeks after completion of treatment.

Protection of trial subjects:

Trial exclusion criteria were designed to minimize the risk of hypercalcemia or renal stones (known side effects of vitamin D therapy); drug exclusions were designed to minimize the risk of interactions with vitamin D.

Adverse events were sought at each clinic visit; the directly observed nature of the vitamin D administration once a month ensured close observation of participants throughout the trial.

Background therapy:

Standard HCV therapy was commenced 1-4 weeks after the first dose of vitamin D or placebo. Standard treatment for HCV is generally for 24 weeks. Some genotype 1 patients who do not respond to therapy at week 4 or 12 will have all anti-viral therapy stopped. Other genotype 1 patients who respond but do not become virus negative by 12 weeks of therapy will continue on a further 24 week course of standard therapy, total duration 48 weeks. Standard therapy for HCV genotype 1 patients changed as the trial commenced and some patients received sofosbuvir in addition to interferon for 12 weeks.

Evidence for comparator:

Placebo was selected (in addition to standard therapy) as the aim of the trial was to test efficacy of vitamin D in addition to standard therapy, rather than instead of standard therapy.

Actual start date of recruitment	01 November 2013
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	United Kingdom: 72
Worldwide total number of subjects	72
EEA total number of subjects	72

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37	0

wk	
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	72
From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

Participants were recruited from hepatitis C treatment services across multiple Scottish secondary care sites

Pre-assignment

Screening details:

At the screening visit all participants had their medical history taken and gave written informed consent. Confirmation of HCV diagnosis by viral genotype and viral load by PCR was taken from the last available values in the medical notes.

Period 1

Period 1 title	Randomised treatment (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Monitor, Data analyst, Carer, Assessor

Blinding implementation details:

Matching IMP and placebo (base oil) were prepared by an independent provider (Tayside Pharmaceuticals) who dispensed identical bottles with no external indication of allocation group

Arms

Are arms mutually exclusive?	Yes
Arm title	Vitamin D3

Arm description:

Oral vitamin D3 100,000 units once per month

Arm type	Experimental
Investigational medicinal product name	Cholecalciferol
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Oral solution
Routes of administration	Oral use

Dosage and administration details:

100,000 units once a month, given as 5mls of 20,000 units/ml product (Vigantol oil)

Arm title	Placebo
------------------	---------

Arm description:

Matching placebo given once a month

Arm type	Placebo
Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Oral solution
Routes of administration	Oral use

Dosage and administration details:

5mls of matching placebo (Mygliol oil as used as base oil in Vigantol oil preparation) given once a month

Number of subjects in period 1	Vitamin D3	Placebo
Started	35	37
Completed	30	30
Not completed	5	7
Lost to follow-up	5	7

subjects affected / exposed	4 / 35 (11.43%)	0 / 37 (0.00%)	
occurrences (all)	4	0	

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
31 October 2013	Revision of protocol to v2.0 with additional exclusion criteria added

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

Recruited fewer participants than originally powered for. Changes in background therapy for hepatitis C mean results may not now be applicable to current standard of care. High cure rates in placebo group limit ability to detect treatment effect.

Notes:
