

Clinical trial results:

A Phase III, Randomized, Double-Blind, Multicenter Study to Evaluate the Efficacy and Safety of the Combination of Ertugliflozin (MK-8835/PF-04971729) with Sitagliptin Compared with Ertugliflozin Alone and Sitagliptin Alone, in the Treatment of Subjects with T2DM With Inadequate Glycemic Control on Metformin Monotherapy

| Global end of trial reached? | Yes |
| Global end of trial date | 26 May 2016 |
| Was the trial ended prematurely? | No |

Notes:

General information about the trial

Main objective of the trial:

This is a study of co-administration of ertugliflozin (MK-8835/PF-04971729) and sitagliptin given together or alone along with metformin in participants with type 2 diabetes mellitus (T2DM) and inadequate glycemic control on metformin monotherapy. The primary hypothesis of this study is that ertugliflozin 5 mg or 15 mg daily plus sitagliptin 100 mg daily provides greater hemoglobin A1C (A1C) - lowering compared with sitagliptin 100 mg daily alone.

Protection of trial subjects:

This study was conducted in conformance with Good Clinical Practice standards and applicable country and/or local statutes and regulations regarding ethical committee review, informed consent, and the protection of human subjects participating in biomedical research.

Participants who meet pre-specified glycemic criteria and who are rescued will receive oral tablets of open-label glimepiride or insulin glargine injected subcutaneously at dose strengths determined by the investigator.

Background therapy:

For participants requiring metformin dose adjustment, metformin will be titrated over a period of up-to 4 weeks before the required dose-stabilization period (≥ 8 weeks) begins. While receiving blinded investigational product during the double-blind treatment period, participants will also receive metformin ≥ 1500 mg/day, tablets, oral, for 52 weeks.

Evidence for comparator: -

| | |
|---|---------------|
| Actual start date of recruitment | 22 April 2014 |
| Long term follow-up planned | No |
| Independent data monitoring committee (IDMC) involvement? | Yes |

Notes:

Notes:

Subjects enrolled per age group

| | |
|---|------|
| In utero | 0 |
| Preterm newborn - gestational age < 37 wk | 0 |
| Newborns (0-27 days) | 0 |
| Infants and toddlers (28 days-23 months) | 0 |
| Children (2-11 years) | 0 |
| Adolescents (12-17 years) | 0 |
| Adults (18-64 years) | 1034 |
| From 65 to 84 years | 199 |
| 85 years and over | 0 |

Subject disposition

Recruitment

Recruitment details:

Participants were randomized at 204 sites in 21 countries.

Pre-assignment

Screening details:

Male and female participants with Type 2 diabetes mellitus of at least 18 years of age were enrolled in this trial.

Period 1

| | |
|------------------------------|---------------------------------------|
| Period 1 title | Overall Study Period (overall period) |
| Is this the baseline period? | Yes |
| Allocation method | Randomised - controlled |
| Blinding used | Double blind |
| Roles blinded | Investigator, Subject |

Arms

| | |
|------------------------------|--------------------|
| Are arms mutually exclusive? | Yes |
| Arm title | Ertugliflozin 5 mg |

Arm description:

Ertugliflozin 5 mg once daily, placebo to ertugliflozin once daily, placebo to sitagliptin once daily, and metformin \geq 1500 mg/day, all for 52 weeks

| | |
|--|----------------------|
| Arm type | Experimental |
| Investigational medicinal product name | Ertugliflozin |
| Investigational medicinal product code | |
| Other name | MK-8835, PF-04971729 |
| Pharmaceutical forms | Tablet |
| Routes of administration | Oral use |

Dosage and administration details:

Ertugliflozin, 5 mg, once daily, orally for 52 weeks

| | |

| Subject analysis set description: Ertugliflozin 15 mg once daily, sitagliptin 100 mg once daily, and metformin \geq 1500 mg/day, all for 52 weeks | |

Primary: Change from Baseline in Hemoglobin A1C (A1C) at Week 26 Excluding Data After Initiation of Rescue Therapy

| | |
|-----------------|---|
| End point title | Change from Baseline in Hemoglobin A1C (A1C) at Week 26 Excluding Data After Initiation of Rescue Therapy |
|-----------------|---|

End point description:

Hemoglobin A1C is blood marker used to report average blood glucose levels over prolonged periods of time and is reported as a percentage (% glycated hemoglobin). Thus, this change from baseline reflects the Week 26 A1C minus the Week 0 A1C. The population analyzed included all randomized, treated participants who had at least 1 baseline or post-baseline A1C measurement. Rescue Therapy: Participants who met pre-specified glycemic criteria were rescued with oral tablets of open-label glimepiride or insulin glargine injected subcutaneously at dose strengths determined by the investigator.

Secondary: Change from Baseline in β -cell Responsivity Static Component (Φ_s) (10-9min⁻¹) From the 8-Point Meal Tolerance Test (MMTT at Week 26

| | |
|-----------------|---|
| End point title | Change from Baseline in β -cell Responsivity Static Component (Φ_s) (10-9min ⁻¹) From the 8-Point Meal Tolerance Test (MMTT at Week 26 |
|-----------------|---|

End point description:

Measurements of plasma glucose, insulin and C-peptide collected, and urine samples were used to

assess parameters of insulin sensitivity and β -cell function. The oral C-peptide minimal model was used to assess the responsiveness of beta-cells to glucose challenge. The model utilizes the fact that C-peptide and insulin are secreted in an equal-molar fashion. The model parameters, i.e. α , β , k , (and h) were estimated in Simulation, Analysis, and Modeling Software for tracer and pharmacokinetic studies (SAAM II) using least squares approach. The endpoint Φ_s (β -cell responsivity static component) is a function of α and is calculated inside SAAM II, by specifying the formula in the Equation section of the STU file: $\Phi_s = \beta / 0.05551$, the unit is 10^{-9} min^{-1} . A higher number indicates greater β -cell responsivity. The population analyzed included all randomized, treated participants who had at least 1 baseline or post-baseline Φ_s measurement.

Adverse events

Adverse events information

Timeframe for reporting adverse events:

Up to 54 weeks

Adverse event reporting additional description:

The safety population was the All-Subjects-As-Treated (ASaT) Population. The ASaT Population consisted of all randomized participants who took at least one dose of trial treatment. Participants were included in the treatment group corresponding to the trial treatment they actually took for the analysis of safety data.
