

Clinical trial results:

REASURE: A phase II randomised trial of biomarkers to assess (dose-) response in patients with metastatic castration resistant prostate cancer treated with radium-223

Summary

EudraCT number	2013-004055-20
Trial protocol	GB
Global end of trial date	06 October 2023

Results information

Result version number	v1 (current)
This version publication date	17 October 2024
First version publication date	17 October 2024
Summary attachment (see zip file)	Radium-223 in metastatic castration-resistant prostate cancer: whole-body diffusion-weighted magnetic resonance imaging scanning to assess response (Published version - Parker et al.pdf)

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	11 January 2021
Is this the analysis of the primary completion data?	Yes
Primary completion date	11 January 2021
Global end of trial reached?	Yes
Global end of trial date	06 October 2023
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The principal research question is: can response to radium-223, in patients with CRPC and bone metastases, be measured reliably by functional imaging and/or circulating biomarkers? The primary objective is to evaluate patients' response to treatment using a type of imaging technique called whole body diffusion-weighted MRI (DW-MRI).

Protection of trial subjects:

For trial entry and optional tissue donation, patients were given a verbal explanation, discussion and written information. The Principal Investigator at each site was responsible for ensuring written informed consent was obtained for each patient. Eligible patients were given as much time as they needed to consider, ask questions and come to a decision about entering the trial, prior to giving consent for entering the trial. The patient information sheet described which parties would have access to their identifiable personal information and patients were asked to give consent to this. The trial was overseen by an Independent Data Monitoring Committee, who reviewed the accumulating trial data and could recommend stopping the trial if there was any cause for concern about patient safety and if this were the case the patient's oncologist would be notified.

Background therapy:

none

Evidence for comparator:

The evaluation of bone predominant disease in patients with metastatic prostate cancer remains challenging. As yet, there is no reliable method to assess and quantify treatment response. Therefore bone metastases are often regarded as non-measurable disease by standard RECIST (v1.1)/PCWG2 criteria [40]. Criteria exist which use radiographic changes to measure response but these are relatively insensitive, taking a number of months for changes to occur [41]. In addition, the criterion of sclerosis of previously osteolytic metastases is not relevant for metastatic disease that is predominantly sclerotic at baseline (as is common in prostate cancer). Given that assessment of response of bone metastases is insensitive and often non-specific, in practice a combination of clinical, biochemical (e.g PSA and ALP) and radiological measures are currently used. However, more accurate means of monitoring response are required to inform early treatment failure or success.

Radium-223 was the first bone targeted alpha emitter to be tested in phase III studies. It has demonstrated improved survival for this group of patients with a favourable risk/benefit profile. Radium-223 was approved by the FDA in May 2013 for the treatment of CRPC with bone metastases and was granted marketing authorisation in the EU in November 2013. It is currently authorised to be marketed in more than 43 countries. The present study will explore the role of functional imaging and circulating biomarkers to assess response to radium-223 and potential dose-response relationships.

Actual start date of recruitment	27 May 2015
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	United Kingdom: 39
Worldwide total number of subjects	39
EEA total number of subjects	0

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	2
From 65 to 84 years	37
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

Between 7/2015 and 6/2017, 39 patients were recruited from 3 UK hospital sites.

Pre-assignment

Screening details:

Inclusion criteria included histologically/cytologically confirmed adenocarcinoma of the prostate with castrate resistant disease, serum PSA ≥ 2 ng/ml, ECOG performance status 0-2, life expectancy > 6 months, and multiple skeletal metastases (≥ 2 hotspots).

Period 1

Period 1 title	REASURE trial overall (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
Arm title	55 kBq/kg Radium 223

Arm description:

Participants in this arm were allocated to receive 55 kBq/kg of Radium 223. Allocation ratio between the 2 arms was 1:1. Treatment allocation was via minimisation with a random element; balancing factors included patient weight, total ALP and current bisphosphonate use. Dose allocation was not blinded. Patients received treatment with radium-223 at the allocated dose via IV administration every 4 weeks for up to 6 cycles.

Arm type	Experimental
Investigational medicinal product name	Radium 223
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection
Routes of administration	Intravenous use

Dosage and administration details:

Patients received treatment with radium-223 at 55 kBq/kg via IV administration every 4 weeks for up to 6 cycles.

Arm title	88 kBq/kg Radium 223
------------------	----------------------

Arm description:

Patients received treatment with radium-223 at the 88 kBq/kg via IV administration every 4 weeks for up to 6 cycles.

Arm type	Experimental
Investigational medicinal product name	Radium 223
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection
Routes of administration	Intravenous use

Dosage and administration details:

Patients received treatment with radium-223 at 88 kBq/kg via IV administration every 4 weeks for up to 6 cycles.

Number of subjects in period 1	55 kBq/kg Radium 223	88 kBq/kg Radium 223
Started	20	19
Completed	20	17
Not completed	0	2
Consent withdrawn by subject	-	1
Protocol deviation	-	1

Adverse events

Adverse events information

Timeframe for reporting adverse events:

From trial entry up to 4 weeks following treatment discontinuation.

Adverse reactions were recorded until 1 year post treatment.

Adverse event reporting additional description:

Any adverse events reported after baseline by at least 5% of the safety population (i.e. all those who received at least 1 dose of radium 223) are reported.

Assessment type	Systematic

subjects affected / exposed	3 / 38 (7.89%)		
occurrences (all)	3		
Metabolism and nutrition disorders			
Decreased appetite			
subjects affected / exposed	9 / 38 (23.68%)		
occurrences (all)	22		
Hypercholesterolaemia			
subjects affected / exposed	2 / 38 (5.26%)		
occurrences (all)	9		

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
22 February 2016	Change in dose from 50kBq/kg to 55kBq/kg and from 80kBq/kg to 88kBq/kg following world-wide NIST primary reference standard revision. Inclusion criteria changed from age ≥ 16 years to age ≥ 18 years to reflect ARSAC guidance
01 October 2018	Addition of a new objective, endpoints statistical considerations and follow up schedule to investigate the incidence of fractures post radium-223. Clarification of existing statistical and imaging considerations.
15 October 2021	Inclusion of additional exploratory endpoint related to overall survival and collection of survival data beyond 1 year.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
