

Clinical trial results:

A randomised, placebo controlled trial of extra-oesophageal reflux treatment in the management of upper respiratory symptoms. [TOPPITS: Trial of Proton Pump Inhibitors in Throat Symptoms]

Summary

EudraCT number	2013-004249-17
Trial protocol	GB
Global end of trial date	23 March 2018

Results information

Result version number	v1 (current)
This version publication date	27 November 2019
First version publication date	27 November 2019

Trial information

Trial identification

Sponsor protocol code	NCTU:6831
-----------------------	-----------

Additional study identifiers

ISRCTN number	ISRCTN38578686
ClinicalTrials.gov id (NCT number)	-
WHO universal trial number (UTN)	-

Notes:

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	23 March 2018
Is this the analysis of the primary completion data?	Yes
Primary completion date	23 March 2018
Global end of trial reached?	Yes
Global end of trial date	23 March 2018
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

To compare the symptomatic response in patients with persistent throat symptoms at the end of four months' (16 weeks') therapy of treatment with lansoprazole versus placebo.

Protection of trial subjects:

None

Background therapy:

None

Evidence for comparator:

Placebo control was chosen for this trial, as Extra Oesophageal Reflux (EOR) symptoms have long been recognised as having a strong placebo response. There is a growing trend to treat throat symptom patients empirically with proton pump inhibitors (PPIs), but most controlled studies fail to demonstrate a significant benefit of PPI over placebo. Hence, a placebo-controlled trial was chosen, to establish any benefit.

Actual start date of recruitment	03 March 2014
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	United Kingdom: 346
Worldwide total number of subjects	346
EEA total number of subjects	346

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	267

From 65 to 84 years	79
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

The recruitment period ran from 27 May 2014 until 28 February 2017, at eight NHS hospital sites in the United Kingdom. Sites were in Newcastle upon Tyne, Sunderland, Nottingham, Brighton, Manchester, Birmingham and Stockport in England, and Glasgow in Scotland.

Pre-assignment

Screening details:

Potential participants will be referred direct from primary care, or by scrutiny of hospital/GP/primary care referral letters. All eligible (RSI ≥ 10), potential participants will be informed about TOPPITS, receive an invitation letter and PIS in the post, and be booked onto a TOPPITS screening clinic.

Period 1

Period 1 title	Baseline
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Monitor, Assessor

Blinding implementation details:

Placebo-matched capsules were made, to establish the blind from trial start. Sealed codebreak envelopes were stored in the Pharmacy/ISF, and opened only in an emergency, with CI authorisation. If the code was broken, participant number, staff name, why and when were recorded. At 12 months, participants were asked if they thought they were on lansoprazole or placebo, and why. The blind was maintained until all trial data were collected and the database locked, when participants were unblinded.

Arms

Are arms mutually exclusive?	Yes
Arm title	Treatment

Subject analysis sets

Subject analysis set title	All trial participants
Subject analysis set type	Full analysis
Subject analysis set description:	
This covers all trial participants, whether compliant or not.	
Subject analysis set title	Pragmatic ITT group
Subject analysis set type	Intention-to-treat
Subject analysis set description:	
A distribution approach was used to determine a clinically relevant compliance window, to maximise inclusion of participants and exclude only significant outliers. Thus the compliant ITT group was defined, including all ineligible and protocol violator participants, in their randomised treatment groups, attending the 16-week follow-up visit at any time, and completing outcome measures at any time point. Secondary analysis, of the primary outcome measure, was of this group.	
Subject analysis set title	Compliant Intention to Treat (ITT) group
Subject analysis set type	Modified intention-to-treat
Subject analysis set description:	
A distribution approach was used to determine a clinically relevant compliance window, to maximise inclusion of participants and exclude only significant outliers. Thus the compliant ITT group was defined, including all ineligible and protocol violator participants, in their randomised treatment groups, attending the 16-week follow-up visit between 14 and 20 weeks, and completing outcome measures within 14 to 20 weeks of randomisation. Primary comparative analyses were of this group.

Primary: RSI score at 16 weeks

End point title	RSI score at 16 weeks
End point description: Symptomatic response measured using the Reflux Symptom Index (RSI) in patients with persistent throat symptoms at the end of 16 weeks' therapy with lansoprazole versus placebo. The RSI score is calculated from a nine-item, self-administered questionnaire scored on a Likert scale with each item score ranging from 0-5 giving a total score range of 0-45. A higher score indicates more severe symptoms.	
End point type	Primary
End point timeframe: 16 weeks post-randomisation.

Statistical analyses

Statistical analysis title	Two sample t test compliant ITT group
Statistical analysis description:	
Univariate analysis of unadjusted primary outcome measure for compliant analysis group.	
Comparison groups	Compliant Intention to Treat (ITT) group v Compliant Intention to Treat (ITT) group
Number of subjects included in analysis	220
Analysis specification	Pre-specified
Analysis type	equivalence ^[1]
P-value	= 0.162 ^[2]
Method	t-test, 2-sided
Parameter estimate	Mean difference (final values)
Point estimate	1.86
Confidence interval	
level	95 %
sides	2-sided
lower limit	-0.76
upper limit	4.487
Variability estimate	Standard error of the mean
Dispersion value	1.33

Notes:

[1] - The primary hypothesis to be tested is H0: The mean RSI scores at primary end-point (16-week visit) are equal for both arms (lansoprazole v placebo). A two-sided significance level of p<0.05 is used throughout.

[2] - Test statistic: t=1.402, two-sided P-value= 0.162, concluding that there is no statistically significant difference in the RSI score at 16 weeks between lansoprazole and placebo.

Statistical analysis title	Multilevel mixed effect linear regression
Statistical analysis description:	
Adjusted for stratification factor recruiting centre (as a random effect) at randomisation and baseline severity in terms of RSI-HB as a continuous measure (as a fixed effect).	
Comparison groups	Compliant Intention to Treat (ITT) group v Compliant Intention to Treat (ITT) group
Number of subjects included in analysis	220
Analysis specification	Pre-specified
Analysis type	equivalence ^[3]
P-value	= 0.196 ^[4]
Method	Mixed models analysis
Parameter estimate	Mean difference (final values)
Point estimate	1.4
Confidence interval	
level	95 %
sides	2-sided
lower limit	-0.7
upper limit	3.5
Variability estimate	Standard error of the mean
Dispersion value	1.091

Notes:

[3] - The continuous covariate (RSI-HB) was explored to assess whether transformation of RSI-HB was a better fit to the relationship with outcome than an untransformed continuous measure based on a reduction in Akaike information criterion (AIC). There was no reduction in AIC so to build the most parsimonious, clinically interpretable model, RSI-HB was retained as an un-transformed continuous covariate, under the assumption of linearity with outcome

[4] - There is no statistically significant difference between randomised arms, lansoprazole compared to placebo (p=0.196), when adjusted for site and baseline continuous RSI-HB.

Statistical analysis title	Two sample t test pragmatic ITT group
Statistical analysis description:	
Univariate analysis of unadjusted primary outcome measure for compliant analysis group.	
Comparison groups	Pragmatic ITT group v Pragmatic ITT group
Number of subjects included in analysis	267
Analysis specification	Pre-specified
Analysis type	equivalence ^[5]
P-value	= 0.309 ^[6]
Method	t-test, 2-sided
Parameter estimate	Mean difference (final values)
Point estimate	1.19
Confidence interval	
level	95 %
sides	2-sided
lower limit	-1.11
upper limit	3.5
Variability estimate	Standard error of the mean
Dispersion value	1.17

Notes:

[5] - The secondary hypothesis to be tested is H0: The mean RSI scores at primary end-point (16-week visit) are equal for both arms (lansoprazole v placebo). A two-sided significance level of p<0.05 is used throughout.

[6] - Test statistic: t=1.020, two-sided P-value= 0.154, concluding that there is no statistically significant difference in the RSI score at 16 weeks between lansoprazole and placebo.

Statistical analysis title	Multilevel mixed effect linear regression
Statistical analysis description:	
Adjusted for stratification factor recruiting centre (as a random effect) at randomisation and baseline severity in terms of RSI-HB as a continuous measure (as a fixed effect).	
Comparison groups	Pragmatic ITT group v Pragmatic ITT group
Number of subjects included in analysis	267
Analysis specification	Pre-specified
Analysis type	equivalence ^[7]
P-value	= 0.264 ^[8]
Method	Mixed models analysis
Parameter estimate	Mean difference (final values)
Point estimate	1.11
Confidence interval	
level	95 %
sides	2-sided
lower limit	-0.83
upper limit	3.05
Variability estimate	Standard error of the mean
Dispersion value	0.99

Notes:

[7] - The continuous covariate (RSI-HB) was explored to assess whether transformation of RSI-HB was a better fit to the relationship with outcome than an untransformed continuous measure based on a reduction in Akaike information criterion (AIC). There was no reduction in AIC so to build the most parsimonious, clinically interpretable model, RSI-HB was retained as an un-transformed continuous covariate, under the assumption of linearity with outcome

[8] - There is no statistically significant difference between randomised arms, lansoprazole compared to placebo (p=0.264), when adjusted for site and baseline continuous RSI-HB.

Secondary: RSI at 12 months

End point title	RSI at 12 months
End point description:	
End point type	Secondary
End point timeframe:	
This is RSI score at 12 months' participation - eight months after the end of the treatment period.

Number of subjects analysed	82	99	181	
Units: none				
arithmetic mean (confidence interval 95%)	16.0 (13.6 to 18.4)	13.6 (11.7 to 15.5)	14.7 (13.2 to 16.2)	

Statistical analyses

Statistical analysis title	Univariate analysis of unadjusted 2-sample t-test
Statistical analysis description:	
Univariate analysis of unadjusted primary outcome measure for compliant analysis group at 12 months.	
Comparison groups	Treatment v Placebo v Compliant Intention to Treat (ITT) group
Number of subjects included in analysis	362
Analysis specification	Pre-specified
Analysis type	equivalence
P-value	= 0.115 ^[9]
Method	t-test, 2-sided
Parameter estimate	Mean difference (net)
Point estimate	2.41
Confidence interval	
level	95 %
sides	2-sided
lower limit	-0.59
upper limit	5.414
Variability estimate	Standard error of the mean
Dispersion value	1.52

Notes:

[9] - Test statistic: $t=1.583$, two-sided P-value= 0.115, concluding that there is no statistically significant difference in the RSI score at 12 months between lansoprazole and placebo.

Statistical analysis title	Multivariable analysis of RSI at 12 months
Statistical analysis description:	
Compliant ITT group	
Comparison groups	Treatment v Placebo v Compliant Intention to Treat (ITT) group
Number of subjects included in analysis	362
Analysis specification	Pre-specified
Analysis type	equivalence
P-value	= 0.157 ^[10]
Method	Mixed models analysis
Parameter estimate	Mean difference (final values)
Point estimate	1.7
Confidence interval	
level	95 %
sides	2-sided
lower limit	-0.7
upper limit	4.1
Variability estimate	Standard error of the mean
Dispersion value	1.22

Notes:

[10] - No statistically significant difference between lansoprazole and placebo, when adjusted for site and baseline continuous RSI-HB. Estimated difference that lansoprazole participants have RSI score at 12 months 1.7 points higher (worse) than placebo.

Adverse events

Adverse events information

Timeframe for reporting adverse events:

All non-SAEs/SARs occurring during drug treatment were reported on the eCRF system within four weeks of the form being due.

Adverse event reporting additional description:

All Adverse Events were recorded. PIs were responsible for managing all AEs/ARs according to local protocols.

Assessment type	Systematic

07 December 2015	<p>Updated Reference Safety Information (RSI) for the trial, in response to risk assessment.</p> <p>Correction of exclusion criteria, in response to minor safety issue.</p> <p>Correction of Statistician name updated as part of previous Amendment, but not included in protocol at that time.</p>
03 March 2017	<p>Change in Principal Investigator at the Sunderland site</p> <p>Addition of Senior Clinical Trial Statistician to the trial team, who replaces current Statistician as signatory on trial protocol</p> <p>Minor updates to trial protocol</p> <p>Update of relevant authorities of Funder-approved extension of trial, including exceeding planned sample size</p>

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

Despite extensive efforts, the PPI strand of the trial proved disappointing. Improvements could be made to investigate reasons for non-engagement, consulting patients who declined participation or with other symptoms, and involving site staff more.
