Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	02 July 2015
Is this the analysis of the primary completion data?	Yes
Primary completion date	30 January 2015
Global end of trial reached?	Yes
Global end of trial date	30 January 2015
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The primary objective of this study is to assess the efficacy and safety of different doses of rhNGF when administered as eye drops to patients with Dry Eye.

on the basis of the following assessments:

- Symptom Assessment in Dry Eye (SANDE)
- Ocular surface vital staining (National Eye Institute [NEI] scales)
- Schirmer test type I (without anaesthesia)

performed on days 1, 8±1, 29±1 and 56±4. Changes from baseline (screening visit) will be evaluated.

- Treatment-emergent adverse events (TEAEs), assessed throughout the study

Protection of trial subjects:

The study protocol final version 2.0, 10JAN14, the Investigator's brochure and all other relevant documentation were reviewed and approved by an independent Ethics Committee (Ethik-Kommission der Medizinischen Fakultät der Universität Wien und des Allgemeines Krankenhauses der Stadt Wien AKH", Vienna; Appendix 16.1.3) on 20JAN14. Ref. nr. 2029/2013.

The study was performed in accordance with the relevant guidelines and the Declaration of Helsinki. The present clinical trial was carried out according to the general principles of: "ICH Harmonised Tripartite Guidelines for Good Clinical Practice "ICH Topic E6, CPMP/ICH/135/95, July 1996 including post Step 4 errata, status September 1997 and post Step 5 errata (linguistic corrections), July 2002.

Before being admitted to the clinical study, subjects expressed their consent to participate. The investigator explained the nature, scope and possible consequences of the clinical study in an understandable form. Information was provided to the subjects in both oral and written form. Each patient received a copy of the written informed consent form, signed by them and the investigator.

Background therapy:

Required use of artificial tears for the treatment of dry eye within the 3 months prior to study enrolment.

Current use or recommended use of artificial tears for the treatment of dry eye.

Evidence for comparator:

N.A.

Actual start date of recruitment	24 March 2014
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Austria: 40
Worldwide total number of subjects	40
EEA total number of subjects	40

Notes:

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	34
From 65 to 84 years	6
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

All patients have been recruited in Department of Clinical Pharmacology, Medical University and General Hospital of Vienna, Währinger Gürtel 18-20, A-1090 Vienna, Austria. The date of first enrolment was on 24 March 2014 and the last vol. completed on 30 January 2015.

Pre-assignment

Screening details:

All patients are screened basing on the inclusion and exclusion criteria and than enrolled.

Pre-assignment period milestones

Number of subjects started	40
Number of subjects completed	40

Period 1

Period 1 title	overall trial (overall period)
Is this the baseline period?	Yes
Allocation method	Not applicable
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
Arm title	Group 1

Arm description:

Group 1: rhNGF 20 µg/mL: One drop (35 µL) corresponding to 0.70 µg of rhNGF was instilled into each eye twice a day (b.i.d.) every 12±2 h for a total daily dose of 2.8 µg (both eyes), for 28 consecutive days. Total dose was 78.4 µg/28 days. Batch: f14131; expiry: OCT14.

At the end of the 1st study part (Group 1), the primary efficacy and safety parameters were analysed. Dose escalation proceeded with Group 2 since there were no safety findings that could pose unacceptable risks to patients. In detail, the study continued with the dose of 4 µg/mL since at least 2 out of the 3 primary efficacy parameters improved in Group 1.

Arm type	Experimental
Investigational medicinal product name	rhNGF 20 µg/mL
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Eye drops, solution
Routes of administration	Ophthalmic use

Dosage and administration details:

One drop (35 µL) corresponding to 0.70 µg of rhNGF was instilled into each eye twice a day (b.i.d.) every 12±2 h for a total daily dose of 2.8 µg (both eyes), for 28 consecutive days. Total dose was 78.4 µg/28 days.

Arm title	Group 2
------------------	---------

Arm description:

Group 2: rhNGF 4 µg/mL: One drop (35 µL) corresponding to 0.14 µg of rhNGF was instilled into each eye b.i.d. every 12±2 h for a total daily dose of 0.56 µg, for 28 consecutive days. Total dose was 15.68 µg/28 days.

Primary: Symptom assessment in dry eye (SANDE)

End point title	Symptom assessment in dry eye (SANDE)
-----------------	---------------------------------------

End point description:

The SANDE questionnaire was a short questionnaire to evaluate both dry eye intensity and frequency by using a 100-mm VAS. The patient symptoms of ocular dryness and/or irritation were quantified on the scale based on two questions that inquired about both severity and frequency of symptoms. The patients evaluated their symptoms using the VAS giving the value they were feeling from none to an extreme value. Each VAS value was measured in millimetres from the left end of the line to each patient's mark. The question about symptom severity and the question about symptom irritation were evaluated through 2 distinct 100-mm VAS.

VAS values of SANDE and their changes from baseline are listed and summarised using descriptive statistics by dose group, disease severity at screening and evaluation visit.

VAS values of SANDE were compared within dose group, disease severity and evaluation visit versus their baseline values by a two-sided Wilcoxon signed-rank test with a nominal α level of 0.05

End point type	Primary

Primary: Ocular surface vital staining with lissamine green (LG) (National Eye Institute [NEI] scales)

End point title	Ocular surface vital staining with lissamine green (LG) (National Eye Institute [NEI] scales)
-----------------	---

End point description:

LG impregnated paper strips (EasyOpht, Italy) containing 1.5 mg of the dye were used to detect conjunctival and corneal epithelial defects. As grading scale of the corneal and conjunctival damage, the NEI/Industry Workshop guideline was used. The cornea was divided into five sectors (central, superior, inferior, nasal and temporal), each of which was scored on a scale of 0–3, with a maximal global score of 15. Both nasally and temporally, the conjunctiva was divided into a superior paralimbal area, an inferior paralimbal area and a peripheral area with a grading scale of 0–3 and with a maximal score of 9 for the nasal and temporal conjunctiva. Before placing the strip in the lower fornix of the eye, a drop of sterile saline was added to the strip.

Primary: Schirmer test type I (without anaesthesia)

End point title	Schirmer test type I (without anaesthesia)
End point description: Schirmer plus® strips (Gecis, France) were used. This test was performed to measure aqueous tear secretion prior to the instillation of any dilating or anaesthetic eye drops. Both eyes could be tested at the same time. While the patient was looking upwards, the lower lid was drawn gently downwards and temporarily. The rounded bent end of a sterile strip was inserted into the lower conjunctival sac over the temporal one-third of the lower eyelid margin, without touching directly the Schirmer test strip with the fingers. After 5 min, the Schirmer test strip was removed and the length of the tear absorption on the strip was measured (millimeters/5 min). The wetting distance at 5 min for each eye was recorded. Values of Schirmer's test type I (i.e. tear wetting distance at 5 min) and their changes from baseline (screening visit) are summarised by eye (study eye and non study eye) and evaluation visit and stratified by severity level.	
End point type	Primary

End point title	Treatment-emergent adverse events (TEAEs)
-----------------	---

End point description:

AEs were coded by SOC and Preferred Term (PT), using the MedDRA. AEs were classified as pre-treatment AEs (PTAEs) and TEAEs according to the period of occurrence. TEAEs are summarised by dose and overall. The n° and % of patients with any TEAE and the n° of TEAEs are tabulated by SOC and PT, seriousness, relationship to treatment and severity. TEAEs are summarised in tables of frequency. The n° and % of patients with any TEAE, the n° of TEAEs, the n° and % of patients with any TEAE by severity, the n° of TEAEs by severity, the n° and % of patients with any TEAE related to study drug, the n° of TEAEs related to study drug are presented. Serious TEAEs are summarised by dose. The n° and % of patients with any serious TEAE, the n° of serious TEAEs, the n° and % of patients with any serious

TEAE, n° of serious TEAEs, n° and % of patients with any serious TEAE related to study drug and n° of serious TEAEs related to study drug are presented.

End point type	Primary
End point timeframe: after the first dose of IMP.	

End point values	Group 1	Group 2		
Subject group type	Reporting group	Reporting group		
Number of subjects analysed	20	20		
Units: number of TEAEs				
n° of TEAEs	36	65		
n° of related TEAEs	11	4		
n° of patients with TEAEs	14	15		
n° of patients with related TEAEs	8	3		

Statistical analyses

Statistical analysis title	TEAEs
-----------------------------------	-------

Statistical analysis description:

due to the low number patients it was possible to perform only a descriptive analysis calculation of the percentage of unrelated, related and overall TEAEs occurred

Comparison groups	Group 2 v Group 1
Number of subjects included in analysis	40
Analysis specification	Pre-specified
Analysis type	other
P-value	= 0 [1]
Method	not provided
Parameter estimate	not provided
Point estimate	0
Confidence interval	
level	Other: 0 %
sides	2-sided
lower limit	0
upper limit	0
Variability estimate	Standard deviation
Dispersion value	0

Notes:

[1] - not provided

Secondary: Visual analogue scale (VAS) for ocular tolerability (foreign body sensation, burning/stinging, itching, pain, stick feeling, blurred vision and photophobia)

End point title	Visual analogue scale (VAS) for ocular tolerability (foreign body sensation, burning/stinging, itching, pain, stick feeling, blurred vision and photophobia)
-----------------	--

End point description:

A global ocular tolerability score was determined using a 100 mm VAS on which 0 meant no symptoms

and 100 meant the worst possible discomfort. This evaluation was to be performed before any ophthalmic assessment at each scheduled visit. Specific ocular symptoms to be measured with the VAS included:

foreign body sensation,
burning/stinging,
itching,
pain,
sticky feeling
blurred vision
photophobia

The patients evaluated their symptoms using the VAS giving the value they were feeling from none to an extreme value. The patients were expected to complete the evaluation in about 5 min.

End point type	Secondary
End point timeframe:	
visit 1, visit 2, visit 3, visit 6 and final visit	

End point values	FAS (symptoms assessment in dry eye, gruppo 1)	PP (Symptom assessment in dry eye gruppo 1)	FAS (Symptom assessment in dry eye gruppo 2)	PP (Symptom assessment in dry eye gruppo2)

Statistical analyses

Statistical analysis title	Visual analogue scale (VAS)for ocular tolerability
Statistical analysis description:	
VAS values for ocular tolerability symptoms and their changes from baseline (screening visit assessment) will be listed and summarised using classic descriptive statistics (i.e. arithmetic mean, SD, CV (%), minimum, median and maximum values) by dose group, disease severity at screening, eye (study eye and non study eye) and evaluation visit.	
Comparison groups	FAS (symptoms assessment in dry eye,gruppo 1) v PP (Symptom assessment in dry eye gruppo 1) v FAS (Symptom assessment in dry eye gruppo 2) v PP (Symptom assessment in dry eye gruppo2)
Number of subjects included in analysis	70
Analysis specification	Pre-specified
Analysis type	equivalence
P-value	< 0.05
Method	Wilcoxon (Mann-Whitney)
Parameter estimate	Mean difference (final values)
Point estimate	17.4
Confidence interval	
level	Other: 80 %
sides	2-sided
lower limit	0
upper limit	84
Variability estimate	Standard deviation
Dispersion value	25.8

Secondary: Slit lamp examination (Eyelid - meibomian glands, eyelid – erythema, eyelid - oedema lashes, conjunctiva erythema, lens, iris, anterior chamber)

End point title	Slit lamp examination (Eyelid - meibomian glands, eyelid – erythema, eyelid - oedema lashes, conjunctiva erythema, lens, iris, anterior chamber)
End point description:	
The slit lamp examination was performed before the instillation of any dilating or anaesthetic eye drops or the fluorescein agent (Fluorescein Minims, Fluorescein sodium 2%). The patient was sitting at the slit lamp while being examined. Grading of the eyelids, lashes, conjunctiva, cornea, lens, iris and anterior chamber.	
End point type	Secondary
End point timeframe:	
visit 1, visit 2, visit 3, visit 6 and final visit

lower limit	0
upper limit	2
Variability estimate	Standard deviation
Dispersion value	0.6

Secondary: Schirmer test type II (with anaesthesia)

End point title	Schirmer test type II (with anaesthesia)
-----------------	--

End point description:

This test was performed to measure basal aqueous tear secretion following the instillation of a preservative-free anaesthetic eye drop (Oxybuprocaine Chlorhydrate 0.4%). Both eyes could be tested at the same time. Schirmer plus® strips (Gecis, France) were used.

This test was conducted in a dimly lit room. While the patient looked upwards, the lower lid was drawn gently downwards and temporarily. The rounded bent end of a sterile strip was inserted into the lower conjunctival sac over the temporal one-third of the lower eyelid margin. The test was done without touching directly the Schirmer test strip with the fingers to avoid contamination of skin oils. The patients were instructed to close their eyes gently.

After 5 minutes, the Schirmer test strip was removed and the length of the tear absorption on the strip was measured (mm/5 min).

Secondary: Tear film break-up time (TFBUT)

End point title	Tear film break-up time (TFBUT)
-----------------	---------------------------------

End point description:

Patients with a TFBUT test ≤ 10 in the worse eye (study eye) at the screening visit were eligible for enrolment.

TFBUT was measured by determining the time to tear break-up. The TFBUT was performed after instillation of 5 μ l of 2% preservative-free sodium fluorescein solution (using Fluorescein Minims, Fluorescein sodium 2% Chauvin Pharmaceuticals Ltd, 106 London Road, Kingston-upon-Thames; Surrey KT2 6TN, UK, with UK marketing authorization PL 0033/5008R) into the inferior conjunctival cul-de-sac of each eye. The patient was instructed to blink several times to thoroughly mix the fluorescein with the tear film. In order to achieve maximum fluorescence, the examiner waited approximately 30 seconds after instillation before evaluating TFBUT.

Secondary: Intraocular pressure (IOP)

End point title	Intraocular pressure (IOP)
End point description:	
IOP was performed using either Goldmann applanation tonometry or a handheld applanation tonometer	

(e.g. Tonopen) after the instillation of a topical anaesthetic. IOP was measured in both eyes after completion of all other slit lamp examinations to avoid potential interference with the other evaluations. The patient's position was adjusted until the patient's head was firmly positioned on the chin rest and against the forehead rest without leaning forward or straining. Both eyes were tested, with the right eye preceding the left eye. The same equipment was used throughout the study. IOP for each eye in mmHg was recorded in the CRF.

Secondary: Visual acuity (early treatment diabetic retinopathy study [ETDRS] chart)

End point title	Visual acuity (early treatment diabetic retinopathy study [ETDRS] chart)
-----------------	--

End point description:

Refraction and visual acuity measurements were performed for all patients by trained vision examiners only. The name and certification number of the vision examiner were documented in the patient's visual acuity (VA) worksheet (provided by the Sponsor) at each visit.

Refraction was measured prior to visual acuity testing to obtain best-corrected vision as described below. Best-corrected visual acuity was measured at all visits using standard charts, lighting, and procedures. Best correction was determined by careful refraction at that visit according to the standard protocol for refraction as described below. The refraction equipment required included:

Retroilluminated Light box and ETDRS 4 meter distance acuity chart set

Trial lens frames

Trial lens set with plus or minus cylinder lenses

Jackson cross-cylinders of 0.25, 0.50, and 1.00 diopters

Pinhole occluder

Tissues or eye pads and tape

A 1 meter rigid measuring stick

Visual acuity chart 1 was used for test

Secondary: Tear film osmolarity

End point title	Tear film osmolarity
-----------------	----------------------

End point description:

Tear film osmolarity as a marker of tear film solute content was performed with a TearLab Osmolarity System. The concentration of the tears was assessed in both eyes before the instillation of any dilating or anesthetic drops. To perform the test, the patient was sitting with head tilted back and eyes looking upward towards the ceiling. One hand was placed on the patient's face for stabilisation. The eyelid was not moved away from the eye as pulling the eyelid down would have broken the tear lake and hindered the tear film collection. The handheld TearLab Osmolarity Pen was placed close to the eye just above the outer 1/3 of the lower eyelid and gently lower allowing the bottom of the tip to come into contact with the lower eyelid and the line of moisture along the inner eyelid margin. While avoiding contact with the bulbar conjunctiva, the Pen tip was pressed down lightly on the eyelid to collect the tears.

Statistical analyses

Statistical analysis title	Tear film osmolarity
----------------------------	----------------------

Statistical analysis description:

Values of tear film osmolarity and their changes from baseline (screening visit assessment) will be listed and summarised using classic descriptive statistics (i.e. arithmetic mean, SD, CV (%), minimum, median and maximum values) by dose group, disease severity at screening, eye (study eye and non study eye) and evaluation visit.

Comparison groups	FAS (symptoms assessment in dry eye, gruppo 1) v PP (Symptom assessment in dry eye gruppo 1) v FAS (Symptom assessment in dry eye gruppo 2) v PP (Symptom assessment
-------------------	--

	in dry eye gruppo2)
Number of subjects included in analysis	70
Analysis specification	Pre-specified
Analysis type	equivalence
P-value	< 0.05
Method	Wilcoxon (Mann-Whitney)
Parameter estimate	Mean difference (final values)
Point estimate	308.8

Secondary: Conjunctival impression cytology for goblet cells' count

End point title	Conjunctival impression cytology for goblet cells' count
End point description:	
Values of conjunctival impression cytology for goblet cells' count and their changes from baseline (screening visit assessment), mean±SD of 3 consecutive optic fields and mean±SD of changes from baseline of 3 consecutive optic fields for each impression cytology sample are listed. Mean of 3 consecutive optic fields and mean of changes from baseline of 3 consecutive optic fields for each impression cytology sample are summarised using classic descriptive statistics by dose group, disease severity at ascreening and evaluation visit. Values of conjunctival impression cytology for goblet cells' count were compared within each dose group, disease severity at screening and evaluation visit versus their baseline values by a two-sided Wilcoxon signed-rank test with a nominal α level of 0.05.	
End point type	Secondary

Secondary: Frequency of artificial tears use

End point title	Frequency of artificial tears use
-----------------	-----------------------------------

End point description:

Frequencies of artificial tears use and their changes from baseline (screening visit assessment) are listed and summarised using classic descriptive statistics by dose group, disease severity at screening and evaluation visit. Artificial tears accountability is listed. The average frequency of artificial tear use during the study in the intervals Day 1 - Day 8, Day 9 - Day 29 and Day 30 - Day 56 is listed and summarised using classic descriptive statistics by dose group. The average use for each subject was calculated as the total number of drops used in each period divided by the actual period duration. Data were stratified according to the illness severity level.

Adverse events

Adverse events information

Timeframe for reporting adverse events:

Visit 2 (Day 1 pre-dose); At home(Days 1 evening – 7±1 evening); Visit 3 (Day 8±1 pre-dose); At home(Days 8±1 -14±1); Visit 4; At home(Days 15±1-21±1); Visit 5, At home (Days 22±1 - 28±1); Visit 6 and Final Visit.

Adverse event reporting additional description:

AEs assessed at home are monitored through a diary.

Assessment type	Systematic

Reporting groups

Reporting group title	Group 1
-----------------------	---------

Reporting group description:

Group 1: rhNGF 20 µg/mL: One drop (35 µL) corresponding to 0.70 µg of rhNGF was instilled into each eye twice a day (b.i.d.) every 12±2 h for a total daily dose of 2.8 µg (both eyes), for 28 consecutive days. Total dose was 78.4 µg/28 days. Batch: f14131; expiry: OCT14.

At the end of the 1st study part (Group 1), the primary efficacy and safety parameters were analysed. Dose escalation proceeded with Group 2 since there were no safety findings that could pose unacceptable risks to patients. In detail, the study continued with the dose of 4 µg/mL since at least 2 out of the 3 primary efficacy parameters improved in Group 1.

Reporting group title	Group 2
-----------------------	---------

Reporting group description:

Group 2: rhNGF 4 µg/mL: One drop (35 µL) corresponding to 0.14 µg of rhNGF was instilled into each eye b.i.d. every 12±2 h for a total daily dose of 0.56 µg, for 28 consecutive days. Total dose was 15.68 µg/28 days.

Serious adverse events	Group 1	Group 2	
Total subjects affected by serious adverse events			
subjects affected / exposed	0 / 20 (0.00%)	1 / 20 (5.00%)	
number of deaths (all causes)	0	0	
number of deaths resulting from adverse events	0	0	
Musculoskeletal and connective tissue disorders			
Fall	Additional description: The fall was associated with the concussion and headache: these were reported as 3 distinct TEAEs of moderate intensity, of which only the fall was classified as a SAE. The investigator judged that all 3 TEAEs were unrelated to the IMP.
