

## Clinical trial results:

### Phase III, Randomized, Double-Blind, Double-Dummy, Placebo-Controlled, Multicenter Study to Evaluate the Efficacy (Induction of Remission) and Safety of Etrolizumab Compared With Adalimumab and Placebo in Patients With Moderate to Severe Ulcerative Colitis who are Naive to TNF Inhibitors

#### Summary

EudraCT number	2013-004279-11
Trial protocol	EE BG SK FR
Global end of trial date	19 March 2020

#### Results information

Result version number	v1
This version publication date	14 February 2021
First version publication date	14 February 2021

#### Trial information

##### Trial identification

Sponsor protocol code	GA28948
-----------------------	---------

##### Additional study identifiers

ISRCTN number	-
ClinicalTrials.gov id (NCT number)	NCT02163759
WHO universal trial number (UTN)	-

Notes:

#### Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

## Results analysis stage

Analysis stage	Final
Date of interim/final analysis	19 March 2020
Is this the analysis of the primary completion data?	Yes
Primary completion date	19 February 2020
Global end of trial reached?	Yes
Global end of trial date	19 March 2020
Was the trial ended prematurely?	No

Notes:

## General information about the trial

Main objective of the trial:

-To evaluate the efficacy of etrolizumab (105 mg SC every 4 weeks [Q4W]) compared with placebo for the induction of remission in TNF-naïve patients with ulcerative colitis as determined by the Mayo Clinic Score at Week 10

Protection of trial subjects:

This study was conducted in full conformance with the ICH E6 guideline for Good Clinical Practice and the principles of the Declaration of Helsinki or the laws and regulations of the country in which the research is conducted, whichever afforded the greater protection to the individual. All subjects signed an informed consent form before participating in the study.

Background therapy:

During the induction phase (Day 1 to Week 10), continuation of stable baseline doses of the following non-investigational medicinal products were permitted: oral 5-aminosalicylic acid (5-ASA); azathioprine; 6-mercaptopurine; methotrexate; corticosteroids up to 30 milligrams per day (mg/day) of prednisone (or equivalent); and budesonide up to 9 mg/day. From Week 10 to Week 14, subjects who achieved clinical remission at Week 10 were to continue immunosuppressants (AZA, 6-MP, MTX) at a stable dose unless dose reduction or discontinuation was required due to immunosuppressant-related toxicity. For subjects who stayed in the study, corticosteroids were to be tapered starting from Week 10 in those who achieved clinical remission. Throughout the study, probiotics and oral 5-ASA may have been continued at a stable dose. Occasional use of NSAIDs and acetaminophen (e.g., for headache, arthritis, myalgias, menstrual cramps) and aspirin up to 325 mg daily were permitted throughout the study. Antidiarrheals (e.g., loperamide, diphenoxylate with atropine) for control of chronic diarrhea were permitted throughout the study.

Evidence for comparator: -

Actual start date of recruitment	04 November 2014
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

## Population of trial subjects

### Subjects enrolled per country

Country: Number of subjects enrolled	Argentina: 1
Country: Number of subjects enrolled	Australia: 15
Country: Number of subjects enrolled	Bulgaria: 5
Country: Number of subjects enrolled	Brazil: 36
Country: Number of subjects enrolled	Estonia: 15
Country: Number of subjects enrolled	France: 3
Country: Number of subjects enrolled	Hong Kong: 1
Country: Number of subjects enrolled	Mexico: 4
Country: Number of subjects enrolled	Poland: 79
Country: Number of subjects enrolled	Russian Federation: 57

Country: Number of subjects enrolled	Serbia: 33
Country: Number of subjects enrolled	Slovakia: 29
Country: Number of subjects enrolled	Ukraine: 68
Country: Number of subjects enrolled	United States: 12
Worldwide total number of subjects	358
EEA total number of subjects	131

Notes:

---

### Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	337
From 65 to 84 years	21
85 years and over	0

## Subject disposition

### Recruitment

Recruitment details: -

### Pre-assignment

Screening details:

Subjects on concomitant background therapy were allowed to continue receiving stable baseline doses of the following non-investigational medicinal products during the study: oral 5-ASA; azathioprine; 6-mercaptopurine; methotrexate; corticosteroids up to 30 mg/day of prednisone (or equivalent); and/or budesonide up to 9 mg/day.

### Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator

### Arms

Are arms mutually exclusive?	Yes
<b>Arm title</b>	Placebo

Arm description:

The double-blinded treatment period consisted of a 10-week induction period and an additional 4-week treatment period for participants who met the definition of clinical remission at Week 10. Participants with moderate-to-severe ulcerative colitis who were naive to TNF inhibitors were randomized to this arm to receive placebo matching to etrolizumab subcutaneously (SC) once every 4 weeks (Q4W) up to Week 12 (at Weeks 0 [Day 1], 4, 8, and 12 [clinical remitters only]) and placebo matching to adalimumab SC once every 2 weeks (Q2W) up to Week 8 (at Weeks 0 [Day 1], 2, 4, 6, and 8).

Arm type	Placebo
Investigational medicinal product name	Etrolizumab Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection in pre-filled syringe
Routes of administration	Subcutaneous use

Dosage and administration details:

The placebo matching to etrolizumab was supplied in a pre-filled syringe and was administered as an SC injection once every 4 weeks up to Week 12 (at Weeks 0 [Day 1], 4, 8, and 12 [clinical remitters only]).

Investigational medicinal product name	Adalimumab Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection in pre-filled syringe
Routes of administration	Subcutaneous use

Dosage and administration details:

The placebo matching to adalimumab was supplied in a pre-filled syringe and was administered as an SC injection once every 2 weeks (Q2W) up to Week 8 (at Weeks 0 [Day 1], 2, 4, 6, and 8).

<b>Arm title</b>	Adalimumab
------------------	------------

Arm description:

The double-blinded treatment period consisted of a 10-week induction period and an additional 4-week treatment period for participants who met the definition of clinical remission at Week 10. Participants with moderate-to-severe ulcerative colitis who were naive to TNF inhibitors were randomized to this arm to receive adalimumab subcutaneously (SC) Q2W up to Week 8 (160 mg at Week 0 [Day 1], 80 mg at Week 2, 40 mg at Weeks 4, 6, and 8) and placebo matching to etrolizumab SC Q4W up to Week 12 (at Weeks 0 [Day 1], 4, 8, and 12 [clinical remitters only]).

Arm type	Active comparator
----------	-------------------

Investigational medicinal product name	Adalimumab
Investigational medicinal product code	
Other name	Humira
Pharmaceutical forms	Solution for injection in pre-filled syringe
Routes of administration	Subcutaneous use

**Dosage and administration details:**

Adalimumab was supplied in a pre-filled syringe and was administered as an SC injection once every 2 weeks (Q2W) up to Week 8 (at Weeks 0 [Day 1], 2, 4, 6, and 8). Adalimumab was to be administered at a dose of 160 milligrams (mg) at Week 0 (Day 1; 4 injections), 80 mg at Week 2 (2 injections), and 40 mg (1 injection) at Weeks 4, 6, and 8.

Investigational medicinal product name	Etrolizumab Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection in pre-filled syringe
Routes of administration	Subcutaneous use

**Dosage and administration details:**

The placebo matching to etrolizumab was supplied in a pre-filled syringe and was administered as an SC injection once every 4 weeks up to Week 12 (at Weeks 0 [Day 1], 4, 8, and 12 [clinical remitters only]).

<b>Arm title</b>	Etrolizumab
------------------	-------------

**Arm description:**

The double-blinded treatment period consisted of a 10-week induction period and an additional 4-week treatment period for participants who met the definition of clinical remission at Week 10. Participants with moderate-to-severe ulcerative colitis who were naive to TNF inhibitors were randomized to this arm to receive etrolizumab 105 mg subcutaneously (SC) Q4W up to Week 12 (at Weeks 0 [Day 1], 4, 8, and 12 [clinical remitters only]) and placebo matching to adalimumab SC Q2W up to Week 8 (at Weeks 0 [Day 1], 2, 4, 6, and 8).

Arm type	Experimental
Investigational medicinal product name	Adalimumab Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection in pre-filled syringe
Routes of administration	Subcutaneous use

**Dosage and administration details:**

The placebo matching to adalimumab was supplied in a pre-filled syringe and was administered as an SC injection once every 2 weeks (Q2W) up to Week 8 (at Weeks 0 [Day 1], 2, 4, 6, and 8).

Investigational medicinal product name	Etrolizumab
Investigational medicinal product code	RO5490261
Other name	PRO145223
Pharmaceutical forms	Solution for injection in pre-filled syringe
Routes of administration	Subcutaneous use

**Dosage and administration details:**

Etrolizumab was supplied in a pre-filled syringe and was administered as an SC injection at a dose of 105 mg once every 4 weeks up to Week 12 (at Weeks 0 [Day 1], 4, 8, and 12 [clinical remitters only]).

<b>Number of subjects in period 1</b>	Placebo	Adalimumab	Etrolizumab

Pancolitis	18	35	33
Mayo Clinic Score (MCS) $\leq 9$ or $\geq 10$ at Baseline			
Participants were stratified by concomitant treatment with corticosteroids (yes/no) at randomization, concomitant treatment with immunosuppressants (yes/no) at randomization, and disease activity measured during screening (MCS $\leq 9$ /MCS $\geq 10$ ). The MCS ranges from 0 to 12 and is a composite of the four following assessments of disease activity: stool frequency subscore, rectal bleeding subscore, endoscopy subscore, and physician's global assessment (PGA) subscore. Each of the four assessments was rated with a score from 0 to 3, with higher scores indicating more severe disease.			
Units: Subjects			
MCS $\leq 9$	47	96	100
MCS $\geq 10$	25	46	44
Baseline Treatment: None, Corticosteroids (CS) or Immunosuppressants (IS) Alone, or Both CS and IS			
Participants were stratified by concomitant treatment with corticosteroids (yes/no) at randomization, concomitant treatment with immunosuppressants (yes/no) at randomization, and disease activity measured during screening (MCS $\leq 9$ /MCS $\geq 10$ ).			
Units: Subjects

Reporting group title	Adalimumab
Reporting group description:	
The double-blinded treatment period consisted of a 10-week induction period and an additional 4-week treatment period for participants who met the definition of clinical remission at Week 10. Participants with moderate-to-severe ulcerative colitis who were naive to TNF inhibitors were randomized to this arm to receive adalimumab subcutaneously (SC) Q2W up to Week 8 (160 mg at Week 0 [Day 1], 80 mg at Week 2, 40 mg at Weeks 4, 6, and 8) and placebo matching to etrolizumab SC Q4W up to Week 12 (at Weeks 0 [Day 1], 4, 8, and 12 [clinical remitters only]).	
Reporting group title	Etrolizumab
Reporting group description:	
The double-blinded treatment period consisted of a 10-week induction period and an additional 4-week treatment period for participants who met the definition of clinical remission at Week 10. Participants with moderate-to-severe ulcerative colitis who were naive to TNF inhibitors were randomized to this arm to receive etrolizumab 105 mg subcutaneously (SC) Q4W up to Week 12 (at Weeks 0 [Day 1], 4, 8, and 12 [clinical remitters only]) and placebo matching to adalimumab SC Q2W up to Week 8 (at Weeks 0 [Day 1], 2, 4, 6, and 8).	

### Primary: Percentage of Participants in Remission With Etrolizumab Compared With Placebo at Week 10, as Determined by the Mayo Clinic Score (MCS)

End point title	Percentage of Participants in Remission With Etrolizumab Compared With Placebo at Week 10, as Determined by the Mayo Clinic Score (MCS) <sup>[1]</sup>
End point description:	
The Mayo Clinic Score (MCS) ranges from 0 to 12 and is a composite of the four following assessments of disease activity: stool frequency subscore, rectal bleeding subscore, endoscopy subscore, and physician's global assessment (PGA) subscore. Each of the four assessments was rated with a score from 0 to 3, with higher scores indicating more severe disease. Remission was defined as MCS less than or equal to ( $\leq$ ) 2 with individual subscores $\leq 1$ and a rectal bleeding subscore of 0. Participants were also classified as non-remitters if Week 10 assessments were missing or if they had received permitted/prohibited rescue therapy prior to assessment. Participants were stratified by concomitant treatment with corticosteroids or immunosuppressants at randomization and disease activity measured during screening (MCS $\leq 9$ /MCS $\geq 10$ ); the Cochran-Mantel-Haenszel test adjusted the difference in remission rates and associated 95% confidence interval for the stratification factors.	
End point type	Primary
End point timeframe:	
Week 10	

#### Notes:

[1] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period. Justification: The primary outcome measure only compared remission rates between the etrolizumab and placebo arms.

End point values	Placebo	Etrolizumab

## Secondary: Percentage of Participants With Clinical Response at Week 10, as Determined by the MCS

End point title	Percentage of Participants With Clinical Response at Week 10, as Determined by the MCS
-----------------	--

End point description:

The Mayo Clinic Score (MCS) ranges from 0 to 12 and is a composite of the four following assessments of disease activity: stool frequency subscore, rectal bleeding subscore, endoscopy subscore, and physician's global assessment subscore. Each of the four assessments was rated with a score from 0 to 3, with higher scores indicating more severe disease. Clinical Response was defined as: MCS  $\geq$ 3-point decrease and 30% reduction from baseline as well as  $\geq$ 1-point decrease in rectal bleeding subscore or an absolute rectal bleeding score of 0 or 1. Non-responders also included participants with missing Week 10 assessments or those who had received permitted/prohibited rescue therapy prior to assessment. Participants were stratified by concomitant treatment with corticosteroids or immunosuppressants at randomization and disease activity measured during screening (MCS  $\leq$ 9 or  $\geq$ 10); the CMH test adjusted the differences in response rates and associated 95% CIs for the stratification factors.

### **Secondary: Percentage of Participants With Improvement in Endoscopic Appearance of the Mucosa at Week 10, as Determined by the MCS Endoscopy Subscore**

End point title	Percentage of Participants With Improvement in Endoscopic Appearance of the Mucosa at Week 10, as Determined by the MCS Endoscopy Subscore
-----------------	--

End point description:

Improvement in endoscopic appearance of the mucosa was defined as a Mayo Clinic Score (MCS) endoscopy subscore  $\leq 1$ . Blinded gastroenterologists experienced in inflammatory bowel disease performed central reading of endoscopies at an independent review facility. The rectum, sigmoid, and descending colon segments were assessed and each segment was assigned a score of 0 to 3, with higher scores indicating more severe disease. At baseline all segments were reviewed and the worst score from the three segments was recorded as the endoscopy subscore. Post-baseline the endoscopy score was the worst score of all segments that had been assessed at baseline, if the baseline endoscopy score had a sigmoid colon score  $\leq 1$ . If at baseline the sigmoid colon score was  $\geq 2$ , the post-baseline endoscopy score was the sigmoid colon score value. Non-responders also included participants with missing Week 10 assessments or those who had received permitted/prohibited rescue therapy prior to assessment.

## Secondary: Percentage of Participants With Histologic Remission at Week 10, as

## Determined by the Nancy Histological Index

End point title	Percentage of Participants With Histologic Remission at Week 10, as Determined by the Nancy Histological Index
-----------------	--

End point description:

Histologic remission is defined by the resolution of neutrophilic inflammation (e.g., absence of neutrophils in the crypts and lamina propria), defined by a Nancy Histological Index (NHI) score of  $\leq 1$ . The NHI score ranges from 0 to 4, with the following definitions for each grade: 0 is no histologically significant disease; 1 is chronic inflammatory infiltrate with no acute inflammatory infiltrate; and 2, 3, and 4 are mildly, moderately, and severely active disease, respectively. A small pool of central readers who were blinded to both treatment arm and timepoint performed the histologic scoring. The same reader scored all slides for a given participant based on biopsies from the most inflamed region of the sigmoid colon. Participants were also classified as non-remitters if Week 10 assessments were missing or if they had received rescue therapy prior to assessment. The Cochran-Mantel-Haenszel test adjusted the difference in remission rates and 95% CI for the stratification factors.

## Secondary: Change from Baseline in MCS Rectal Bleeding Subscore at Week 6

End point title	Change from Baseline in MCS Rectal Bleeding Subscore at Week 6
-----------------	--

End point description:

Rectal bleeding data were collected via the participant's diaries and each day a participant provided a score from 0 to 3 according to the following definitions: 0 = no blood in the stool; 1 = streaks of blood with stool less than half the time; 2 = obvious blood with stool most of the time; 3 = blood alone passed. The Mayo Clinic Score (MCS) rectal bleeding subscore was calculated as the worst value of three days of daily diary scores closest to anchor dates at baseline and post-baseline. The data was considered non-parametric and was reported using RANK analysis of covariance (ANCOVA). Participants were stratified by concomitant treatment with corticosteroids or immunosuppressants at randomization and disease activity measured during screening (MCS ≤9/MCS ≥10); the model adjusted for these stratification factors along with the baseline rectal bleeding (RB) subscore.

## Secondary: Change From Baseline in Ulcerative Colitis (UC) Bowel Movement Signs and Symptoms at Week 10, as Assessed by UC Patient-Reported Outcome Signs and Symptoms (UC-PRO/SS)

End point title	Change From Baseline in Ulcerative Colitis (UC) Bowel Movement Signs and Symptoms at Week 10, as Assessed by UC Patient-Reported Outcome Signs and Symptoms (UC-PRO/SS)
-----------------	---

End point description:

The UC-PRO/SS questionnaire was collected in the e-diary and completed by participants for at least 9 to 12 consecutive days prior to a study visit. The bowel movement domain score ranges from 0 to 27, with a higher score indicating a worse disease state. The most recent 7 daily scores available (not including the visit) were selected for the calculation of the visit score. For each item in the questionnaire, a score was calculated for a visit by taking the average of the selected daily scores. The

domain score for a visit was calculated as the sum of the averaged items for each question. A Mixed Model for Repeated Measures (MMRM) analysis of the data included the fixed categorical effects of treatment, visit, study stratification factors, and treatment-by-visit interaction, and the continuous covariates of the baseline UC-PRO/SS domain and baseline UC-PRO/SS domain-by-visit interaction. An unstructured covariance matrix was used to model the within-patient errors within the MMRM.

### **Secondary: Change From Baseline in Health-Related Quality of Life at Week 10, as Assessed by the Total Inflammatory Bowel Disease Questionnaire (IBDQ) Score**

End point title	Change From Baseline in Health-Related Quality of Life at Week 10, as Assessed by the Total Inflammatory Bowel Disease Questionnaire (IBDQ) Score
-----------------	---

End point description:

The IBDQ is a 32-item questionnaire containing four domains: bowel symptoms (10 items), systemic symptoms (5 items), emotional function (12 items), and social function (5 items). An overall total IBDQ score was computed by summing the individual 32-item scores. The range for the IBDQ total score is 32 to 224, with higher scores denoting better health-related quality of life. The unadjusted mean and standard deviation for each study arm are reported. The change from baseline in the IBDQ score was analyzed using an ANCOVA model taking the stratification factors used at randomization into account (concomitant treatment with corticosteroids or immunosuppressants at randomization and disease activity measured during screening [MCS ≤9/MCS ≥10]), and the baseline IBDQ score used as a

covariate.

## Secondary: Pharmacokinetics of Etrolizumab: Serum Concentration

End point title	Pharmacokinetics of Etrolizumab: Serum Concentration <sup>[39]</sup>
End point description:	Serum concentrations of etrolizumab were evaluated at the primary endpoint visit (Week 10) and the secondary endpoint visit (Week 14). Both time points were two weeks after the most recent dose.
End point type	Secondary
End point timeframe:	Weeks 10 and 14

Notes:

[39] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period.

Justification: The PK outcome measure of etrolizumab serum concentration was only assessed for those who had received treatment with etrolizumab.

## Secondary: Number of Participants With at Least One Adverse Event by Severity, According to the National Cancer Institute Common Terminology Criteria for Adverse Events, version 4.0 (NCI CTCAE v4.0)

End point title	Number of Participants With at Least One Adverse Event by Severity, According to the National Cancer Institute Common Terminology Criteria for Adverse Events, version 4.0 (NCI CTCAE v4.0)
-----------------	---

End point description:

An adverse event (AE) is any untoward medical occurrence in a clinical investigation in which a patient is

administered a pharmaceutical product, regardless of causal attribution. The investigator independently assessed the severity and seriousness of each recorded AE. The AE severity grading scale for the NCI CTCAE v4.0 was used for assessing severity; any AE not specifically listed was rated according to the following grading scale from 1 to 5: 1 = mild, 2 = moderate, 3 = severe, 4 = life-threatening, 5 = death. AEs of special interest included: elevated AST/ALT in combination with either elevated bilirubin or clinical jaundice; suspected transmission of infectious agent by the study drug; anaphylactic, anaphylactoid and systemic hypersensitivity reactions; and neurological signs, symptoms, and AEs that may suggest possible progressive multifocal leukoencephalopathy (PML).

## Secondary: Number of Participants by Marked Laboratory Abnormality Status for Hematology Parameters as a Shift Table from Baseline to Week 10

End point title	Number of Participants by Marked Laboratory Abnormality Status for Hematology Parameters as a Shift Table from Baseline to Week 10
-----------------	--

End point description:

Laboratory tests for hematology parameters were performed and values were compared with the Roche marked reference range. A marked abnormality was defined as a test result that was outside of the Roche marked reference range (labelled as 'High' or 'Low') and represented a clinically significant

change from baseline. Not every laboratory abnormality qualified as an adverse event. A laboratory test result must have been reported as an adverse event if it met any of the following criteria: was accompanied by clinical symptoms; resulted in a change in study treatment or a medical intervention; or was clinically significant in the investigator's judgment. The results are presented as a shift from the baseline status to the Week 10 status. Baseline was defined as the last available assessment prior to first receipt of study drug. The 'missing' status only included participants with missing post-baseline values given they had a result at baseline. Abs = absolute count; Ery. = erythrocyte

## More information

### Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
08 April 2014	Protocol Version 2: The protocol was amended to reflect program level recommendations from the US FDA as follows: -The definition of moderate to severe ulcerative colitis (UC) was updated to include stool frequency subscore of $\geq 1$ . -Ulcerative Colitis Disease Activity Assessments section was modified to include that: 1) given the potential for increased rectal bleeding following endoscopic procedures, rectal bleeding MCS will be derived prior to endoscopy; 2) post-baseline endoscopy should be performed on the same day as the study visit instead of 4 days prior to the visit; 3) each segment, instead of the worst affected segment, of the colon up to the splenic flexure (rectum, sigmoid, and descending colon) will be assigned an endoscopic subscore and the score from the worst affected segment up to the splenic flexure is to be used for the MCS calculation; 4) any discrepancy between the endoscopic subscore obtained by the local versus central readers will require a third adjudication read by a different central reader.
23 July 2014	Protocol Version 3: The protocol was amended to simplify the study design and to facilitate early access to open-label etrolizumab to eligible patients as follows: -Administration of adalimumab/adalimumab placebo at Weeks 10 and 12 was removed for all arms (for earlier washout) to facilitate earlier entry into the Open-Label Extension (OLE Part 1) of the OLE-SM (Open-Label Extension-Safety Monitoring) study (Study GA28951). Table "Study Drug Administration Schema" was updated accordingly. - Only patients achieving clinical remission at Week 10 will progress to Weeks 12 and 14 of the study to confirm maintenance of induction. Patients not achieving clinical remission at Week 10 should remain in the blinded study until Week 12 (to enable adalimumab washout) at which time they may enroll in the OLE.
18 September 2015	Protocol Version 4: The protocol was amended following FDA response to a type C request as follows: -Previously, the FDA had mandated a discontinuation of immunosuppressant therapy after Week 10 because of hypothetical risk of PML, resulting in distinct instructions regarding immunosuppressant use in different countries in the protocol. However, the Sponsor recently received agreement from the FDA to amend the global protocol GA28948 to instruct patients to continue their stable, baseline dose of immunosuppressants to the end of study treatment with dose reduction or discontinuation if patient experiences an immunosuppressant-related toxicity. Consequently the protocol was amended to allow patients to continue with immunosuppressant use from baseline to the end of study treatment (with dose reduction or discontinuation of immunosuppressant use permitted in the event of toxicity) in United States. -Following FDA feedback, inclusion criterion for patients at U.S. sites was amended to allow patients who had had an inadequate response to either immunosuppressants and/or corticosteroids to be eligible for the study rather than the previous requirement for failure to immunosuppressants with or without failure to corticosteroids. These two changes aligned United States with the rest of world regarding immunosuppressant use during the study and eligibility requirements for prior immunosuppressant/corticosteroid usage. Contents that indicated the use of immunosuppressants in the United States had to stop at Week 10 was removed.

18 December 2016	Protocol Version 5: The protocol was amended to update and align the safety section with information regarding potential risks for etrolizumab in the current Etrolizumab Investigator's Brochure, Version 10, and to account for a change in adalimumab formulation, as follows: -The protocol was amended to include the use of the new formulation of adalimumab as needed, when supplies of the current formulation (40 mg [0.8mL]) could no longer be procured. The new formulation consisted of 40 mg (0.4 mL) of adalimumab provided in a single-use, 1-mL, glass prefilled syringe with a fixed 29-gauge ½-inch needle. The efficacy, safety, and tolerability profile of the new formulation was comparable to that of the formulation currently in use (40 mg [0.8 mL]). -The protocol was updated and added to include potential hepatic effects to be in line with the safety profile of other anti-integrins, including vedolizumab, for which hepatic adverse events were reported. Although no clear hepatic safety signals emerged to date with etrolizumab, this potential risk was considered to be applicable across the anti-integrin class and would be evaluated in all etrolizumab studies.
30 August 2017	Protocol Version 6: The protocol was amended to enhance recruitment by reducing the complexity of the protocol, particularly at the time of screening and re-screening, as follows: -The requirement for obtaining Medical Monitor approval for extension of the screening period from 28 to 35 days was eliminated to accommodate logistic delays that might arise during the screening period and decrease site burden associated with placing approval requests. The screening window would not be extended beyond 35 days under any circumstances. -The time qualification for derivation of Mayo Clinic Score (MCS) baseline stool frequency and rectal bleeding subscores was redefined to include subscores obtained within 22 days prior to randomization (Day 1). Post-endoscopy subscores might be used, starting 2 days after the screening endoscopy, but only in cases where there were insufficient e-diary data to calculate these subscores prior to the bowel preparation day.
25 October 2018	Protocol Version 7: The protocol was amended primarily to reflect changes in efficacy endpoints. The changes would not impact study conduct at the site level. These changes are as follows: -To assess the onset of action of etrolizumab, secondary efficacy endpoints of change in Mayo Clinic Score (MCS) rectal bleeding and stool frequency subscores from baseline to Week 6 were added. -The secondary efficacy objective to evaluate colonic mucosal alphaE integrin concentration as a biomarker was expanded and would be evaluated as an exploratory efficacy endpoint to support additional biomarker candidate evaluations in the pivotal placebo-controlled studies within the etrolizumab Phase III Program. -Derivation of the MCS endoscopic subscore at post-baseline timepoints was amended to be consistent with emerging normative standards of endoscopic assessment in clinical trials (Sandborn et al. 2017). The sigmoid colon MCS endoscopic subscore would be used (rather than the score from the worst affected segment, i.e., rectum, sigmoid colon, or descending colon) if the baseline sigmoid colon MCS endoscopic subscore was 2-3. The sigmoid colon MCS endoscopic subscore was considered to be more reliable in assessing earlier treatment response.
15 March 2019	Protocol Version 8: The protocol was amended to provide further clarification and exploratory efficacy objectives was modified as follows: -Evaluation of response at Week 10, in subgroups by baseline expression levels of colonic tissue and/or peripheral blood biomarkers, was added to predict patient subgroups with a greater likelihood of responding to etrolizumab.

Notes:

## Interruptions (globally)

Were there any global interruptions to the trial? No

## Limitations and caveats

None reported
