Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	05 September 2016
Is this the analysis of the primary completion data?	Yes
Primary completion date	12 April 2016
Global end of trial reached?	Yes
Global end of trial date	12 April 2016
Was the trial ended prematurely?	Yes

Notes:

General information about the trial

Main objective of the trial:

Evaluation of induction of immune responses against 6 tumor antigens encoded by CV9104 administered by conventional intradermal injection or with a needle-free intradermal injection device.

Protection of trial subjects:

The investigators and all parties involved in this study conducted the study in adherence to the ethical principles based on the Declaration of Helsinki, the German Act on Medical Devices (Medizinproduktegesetz), International Council for Harmonisation (ICH), Good Clinical Practice guidelines, and the applicable national and local laws and regulatory requirements.

The investigator ensured that no subject underwent any study-related examination or activity before giving written informed consent to participate in the study. The investigator informed the subject of the objectives, methods, anticipated benefits and potential risks, and inconveniences of the study. The subject was given opportunity to ask for clarification of any points he did not understand and if necessary, ask for more information. At the end of the interview, the subject was given ample time to come to a decision.

Insurance coverage for all participating subjects was guaranteed according to applicable legal requirements.

Only subjects that met all study inclusion criteria and none of the exclusion criteria were entered in the study. A subject could withdraw his consent to participate in the study at any time without prejudice.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	01 February 2014
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Germany: 48
Worldwide total number of subjects	48
EEA total number of subjects	48

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0

Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	17
From 65 to 84 years	31
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

Subjects were enrolled at 3 centers in Germany. The first subject signed the informed consent form on 23-Jun-2014 and the last subject on 12-Nov-2015.

A total of 48 subjects were randomized out of which 46 were evaluable for their immune responder status.

Pre-assignment

Screening details:

53 subjects were screened, of whom 5 subjects were screening failures because they did not meet the eligibility criteria for the study.

Period 1

Period 1 title	Overall trial (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
Arm title	Arm A

Arm description:

Subjects in Arm A received 4 administrations of CV9104 with the needle-free intradermal injection device (Tropis®) in Weeks 1, 2, 3, and 5 and underwent radical prostatectomy at least 1 week but not later than 2 weeks after the 4th administration (Week 6 or 7).

After surgery, subjects with a confirmed histopathological diagnosis of high risk or very high risk prostate cancer, were offered to receive 2 additional booster administrations of CV9104 starting 8 weeks after surgery (± 1 week) with a 2-week interval.

Arm type	Experimental
Investigational medicinal product name	CV9104
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection in needle-free injector
Routes of administration	Intradermal use

Dosage and administration details:

Subjects received 4 administrations of CV9104 by needle-free intradermal injection. After radical prostatectomy, subjects with high risk or very high risk prostate cancer, were offered to receive 2 additional administrations of CV9104.

One administration with CV9104 included a total of 12 intradermal injections (2 separate injections per individual CV9104 mRNA component) distributed over the 4 limbs (3 injections in each upper arm and thigh). The total dose of CV9104 per administration was 960 μ g mRNA with 80 μ g mRNA per injection (160 μ g per CV9104 mRNA component).

Arm title	Arm B
------------------	-------

Arm description:

Subjects in Arm B received 4 administrations of CV9104 by conventional intradermal injection in Weeks 1, 2, 3, and 5 and underwent radical prostatectomy at least 1 week but not later than 2 weeks after the 4th administration (Week 6 or 7).

After surgery, subjects with a confirmed histopathological diagnosis of high risk or very high risk prostate cancer, were offered to receive 2 additional booster administrations of CV9104 starting 8 weeks after surgery (± 1 week) with a 2-week interval.

Arm type	Experimental
----------	--------------

Investigational medicinal product name	CV9104
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection
Routes of administration	Intradermal use

Dosage and administration details:

Subjects received 4 administrations of CV9104 by conventional intradermal injection. After radical prostatectomy, subjects with high risk or very high risk prostate cancer, were offered to receive 2 additional administrations of CV9104.

One administration with CV9104 included a total of 12 intradermal injections (2 separate injections per individual CV9104 mRNA component) distributed over the 4 limbs (3 injections in each upper arm and thigh). The total dose of CV9104 per administration was 1920 µg mRNA with 160 µg mRNA per injection (320 µg per CV9104 mRNA component).

Arm title	Arm C
------------------	-------

Arm description:

Subjects did not receive any study treatment before the radical prostatectomy.

Subjects with histopathologically confirmed high risk or very high risk disease could receive 6 optional administrations of CV9104 (960 µg mRNA per administration) by needle-free intradermal injection with the Tropis® device 8, 9, 10, 12, 14 and 16 weeks after surgery.

Arm type	No intervention
No investigational medicinal product assigned in this arm

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
11 February 2014	It was added that study treatment was to be permanently discontinued in case of disease progression after radical prostatectomy requiring anti-tumor treatment. Considerations for the sample size estimation were added.
28 May 2014	The number of sites was increased from 1 site to approximately 4 sites. Due to the change from a mono-center to a multi-center study, the role of a central pathologist was no longer applicable. Revision of inclusion criterion 2: the requirement for at least 3 biopsies with confirmed adenocarcinoma with at least 50% tumor infiltration in at least 1 biopsy was removed. To allow for a more exact localization of the tumor, optional magnetic-resonance imaging assessment was included. Dipstick as method for the urinalysis was removed to allow the use of different methods. It was clarified that only those serious adverse events (SAEs) were to be reported to the sponsor after end of the observation period that were considered related by the investigator.
18 July 2014	Revision of inclusion criterion 2: the restriction for subjects to have only 1 criterion for high risk disease (Gleason score of 8-10, a serum PSA <20 ng/mL or cT3a without tumor fixation to adjacent organs) was removed. It was clarified that in case no study medication was administered to a subject, the observation period for adverse events (AEs) was to last until 12 weeks after surgery. The handling and follow-up of AEs after the end of study visit was described in more detail.
24 February 2015	Revision of the primary endpoint: The definition of the primary endpoint was extended to include humoral immune response rates against all RActive® encoded antigens. Humoral immune response rates were to be measured against all 6 RActive®-encoded antigens and not only against 4 of 6 antigens; however ultimately, humoral immune response could only be measured for 4 of the 6 antigens. Blood sampling for HLA-class I and II antigen testing was added for completeness. The reporting requirements of SAEs in regard to the medical device were revised. The definition of the safety analysis set was revised to allow the inclusion of subjects in Arm C.
06 July 2015	Enrolled subjects diagnosed with very high risk prostate cancer after surgery (based on histopathological assessment) were allowed to receive post-surgical administrations of CV9104. It was clarified that the administration of CV9104 was to be completed before the initiation of adjuvant or salvage radiotherapy. It was clarified that if time windows for post-surgical administrations of CV9104 were missed, the respective administration was to be skipped and the next administration was to be performed as scheduled.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
