

Clinical trial results:

A multicentre randomized controlled trial evaluating the rate of sustained remission and the safety when stopping nucleos(t)ide analogue treatment in non-cirrhotic HBeAg-negative chronic Hepatitis B patients with long-term virologic response

Summary

EudraCT number	2013-004882-15
Trial protocol	DE
Global end of trial date	26 January 2022

Results information

Result version number	v1 (current)
This version publication date	20 April 2023
First version publication date	20 April 2023

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	17 January 2023
Is this the analysis of the primary completion data?	Yes
Primary completion date	26 January 2022
Global end of trial reached?	Yes
Global end of trial date	26 January 2022
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The primary objective of the STOP-NUC trial is to assess the potential of treatment cessation of nucleos(t)ide analogue treatment to induce complete and definitive remission in patients showing complete treatment response for at least 4 years. According to the EASL Clinical Practice Guidelines, sustained HBsAg loss will be used as marker for complete remission. We hypothesize that after treatment discontinuation, the rate of complete remissions will be significantly higher than under continued nucleos(t)ide analogue treatment.

Protection of trial subjects:

not applicable

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	18 November 2014
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Germany: 166
Worldwide total number of subjects	166
EEA total number of subjects	166

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	150
From 65 to 84 years	16

85 years and over	0
-------------------	---

Subject disposition

Recruitment

Recruitment details:

From 2014-11-18 to 2018-01-11 a total of 201 patients were registered to the trial, from which 166 were randomised.

The first patient was randomised on 2014-11-27, the last patient on 2018-02-01

Pre-assignment

Screening details:

From 2014-11-18 to 2018-01-11 a total of 201 patients were registered to the trial, from which 166 were randomised.

Period 1

Period 1 title	Overall trial (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes

End points

End points reporting groups

Reporting group title	Stop NUC therapy
Reporting group description: -	
Reporting group title	NUC therapy
Reporting group description: -	

Primary: sustained HBsAg loss up to week 96

End point title	sustained HBsAg loss up to week 96
End point description: HBsAg will be quantified in a central laboratory at every scheduled visit until week 96. HBsAg loss is defined as not detectable HBsAg in all subsequent assessments after HBsAg became undetectable for the first time. If at week 96, HBsAg is for the first time not detectable, a further measurement will be performed at week 108 in order to confirm the HBsAg loss.	
End point type	Primary
End point timeframe: 96 weeks	

End point values	Stop NUC therapy	NUC therapy

Notes:

[1] - 4 drop-outs directly after randomisation are excluded

[2] - 4 drop-outs directly after randomisation are excluded

Statistical analyses

Statistical analysis title	HBsAg loss primary analysis
Statistical analysis description: Fisher's exact test will be used to compare the two treatment groups with respect to the primary endpoint. Wilson's score interval method will be used to provide 95% confidence intervals for the efficacy rates and their difference. Primary analysis will be based on the intent to treat principle (ITT).	
Comparison groups	Stop NUC therapy v NUC therapy
Number of subjects included in analysis	158
Analysis specification	Pre-specified
Analysis type	superiority
P-value	= 0.006
Method	Fisher exact
Parameter estimate	rate difference
Point estimate	10.1

Confidence interval	
level	95 %
sides	2-sided
lower limit	2.2
upper limit	18
