

Clinical trial results:

A Phase II, Randomized, Double-Blind, Placebo-Controlled Study to Evaluate the Safety and Efficacy of Lebrikizumab in Patients With Persistent Moderate to Severe Atopic Dermatitis That is Inadequately Controlled by Topical Corticosteroids

Summary

EudraCT number	2014-000049-56
Trial protocol	DE CZ ES FI NL PL
Global end of trial date	18 April 2016

Results information

Result version number	v1 (current)
This version publication date	04 May 2017
First version publication date	04 May 2017

Notes:

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	29 June 2016
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	18 April 2016
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The main objective of the study was to evaluate the safety and efficacy of lebrikizumab used as adjunctive therapy with topical corticosteroids (TCS), compared with TCS in participants with persistent moderate to severe atopic dermatitis (AD).

Protection of trial subjects:

The study was conducted in accordance with the principles of the "Declaration of Helsinki" and Good Clinical Practice (GCP) according to the regulations and procedures described in the protocol. Approval from the Ethics Committee (EC)/Institutional Review Board (IRB) was obtained before study start. Roche also obtained approval from the relevant Competent Authority prior to starting the study. No modifications were made to the protocol after receipt of the EC/IRB approval.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	18 May 2015
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Country: Number of subjects enrolled	Netherlands: 8
Country: Number of subjects enrolled	Poland: 17
Country: Number of subjects enrolled	Spain: 20
Country: Number of subjects enrolled	Switzerland: 6
Country: Number of subjects enrolled	Australia: 20
Country: Number of subjects enrolled	Canada: 15
Country: Number of subjects enrolled	United States: 34
Worldwide total number of subjects	212
EEA total number of subjects	105

Notes:

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	209
From 65 to 84 years	3
85 years and over	0

Subject disposition

Recruitment

Recruitment details: -

Pre-assignment

Screening details:

A total of 294 participants were screened, 212 participants were randomized, and 209 received at least one dose of study drug.

Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator

Arms

Are arms mutually exclusive?	Yes
Arm title	Lebrikizumab 250 mg Single Dose + TCS

Arm description:

Participants received a single dose of lebrikizumab 250 milligrams (mg) subcutaneous (SC) injection on Day 1 followed by placebo on Week 4 and Week 8. Participants continued to apply TCS cream (triamcinolone acetonide 0.1 percent [%] or hydrocortisone 2.5% cream) twice daily to active skin lesions throughout the 12-week treatment period.

Arm type	Experimental
Investigational medicinal product name	Lebrikizumab
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection in pre-filled syringe
Routes of administration	Subcutaneous use

Dosage and administration details:

Lebrikizumab administered as SC injection as per the schedule specified in the respective arms.

Investigational medicinal product name	Triamcinolone acetonide
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Cream
Routes of administration	Cutaneous use

Dosage and administration details:

Triamcinolone acetonide 0.1% cream was applied twice daily to active skin lesions.

Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection in pre-filled syringe
Routes of administration	Subcutaneous use

Dosage and administration details:

Placebo matched to lebrikizumab

Investigational medicinal product name	Hydrocortisone
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Cream
Routes of administration	Cutaneous use

Dosage and administration details:

Hydrocortisone 2.5% cream was applied twice daily to active skin lesions.

Arm title	Lebrikizumab 125 mg Single Dose + TCS
------------------	---------------------------------------

Arm description:

Participants received a single dose of lebrikizumab 125 mg SC injection on Day 1 followed by placebo on Week 4 and Week 8. Participants continued to apply TCS cream (triamcnenolone acetonide 0.1% or hydrocortisone 2.5% cream) twice daily to active skin lesions throughout the 12-week treatment period.

Arm type	Experimental
Investigational medicinal product name	Lebrikizumab
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection in pre-filled syringe
Routes of administration	Subcutaneous use

Dosage and administration details:

Lebrikizumab administered as SC injection as per the schedule specified in the respective arms.

Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection in pre-filled syringe
Routes of administration	Subcutaneous use

Dosage and administration details:

Placebo matched to lebrikizumab

Investigational medicinal product name	Triamcinolone acetonide
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Cream
Routes of administration	Cutaneous use

Dosage and administration details:

Triamcinolone acetonide 0.1% cream was applied twice daily to active skin lesions.

Investigational medicinal product name	Hydrocortisone
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Cream
Routes of administration	Cutaneous use

Dosage and administration details:

Hydrocortisone 2.5% cream was applied twice daily to active skin lesions.

Arm title	Lebrikizumab 125 mg Q4W + TCS
------------------	-------------------------------

Arm description:

Participants received lebrikizumab 125 mg SC injection every 4 weeks (Q4W) for a total of 3 doses. Participants continued to apply TCS cream (triamcnenolone acetonide 0.1% or hydrocortisone 2.5% cream) twice daily to active skin lesions throughout the 12-week treatment period.

Arm type	Experimental
Investigational medicinal product name	Lebrikizumab
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection in pre-filled syringe
Routes of administration	Subcutaneous use

Dosage and administration details:

Lebrikizumab administered as SC injection as per the schedule specified in the respective arms.

Investigational medicinal product name	Hydrocortisone
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Cream
Routes of administration	Cutaneous use

Dosage and administration details:

Hydrocortisone 2.5% cream was applied twice daily to active skin lesions.

Investigational medicinal product name	Triamcinolone acetonide
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Cream
Routes of administration	Cutaneous use

Dosage and administration details:

Triamcinolone acetonide 0.1% cream was applied twice daily to active skin lesions.

Arm title	Placebo Q4W + TCS Cream
------------------	-------------------------

Arm description:

Participants received placebo Q4W for a total of 3 doses. Participants continued to apply TCS cream (triamcinolone acetonide 0.1% or hydrocortisone 2.5% cream) twice daily to active skin lesions throughout the 12-week treatment period.

Arm type	Placebo
Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection in pre-filled syringe
Routes of administration	Subcutaneous use

Dosage and administration details:

Placebo matched to lebrikizumab

Investigational medicinal product name	Hydrocortisone
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Cream
Routes of administration	Cutaneous use

Dosage and administration details:

Hydrocortisone 2.5% cream was applied twice daily to active skin lesions.

Investigational medicinal product name	Triamcinolone acetonide
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Cream
Routes of administration	Cutaneous use

Dosage and administration details:

Triamcinolone acetonide 0.1% cream was applied twice daily to active skin lesions.

Primary: Percentage of Participants Who Achieved a 50 Percent (%) Reduction From Baseline in EASI Score (EASI-50) at Week 12

End point title	Percentage of Participants Who Achieved a 50 Percent (%) Reduction From Baseline in EASI Score (EASI-50) at Week 12
-----------------	---

End point description:

The EASI score was used to measure the severity and extent of AD and measures erythema, induration-papulation, excoriation and lichenification on a scale of 0 (none) to 3 (severe) on 4 anatomic regions of

the body: head and neck, trunk, upper limbs, and lower limbs. Degree of involvement on each of the 4 anatomic regions is scored on a scale of 0 (no eruption) to 6 (greater than [$>$] 90 %-100% eruption). The total score is the sum of the four body-region scores, maximum=72, minimum=0, with higher scores reflecting greater disease severity. The total qualitative score is multiplied by the degree of involvement for each anatomic region and then multiplied by a constant and summed to yield the EASI score. mITT population.

Secondary: Percentage of Participants Who Achieved an Investigator Global Signs Assessment (IGSA) Score of 0 or 1 at Week 12

End point title	Percentage of Participants Who Achieved an Investigator Global Signs Assessment (IGSA) Score of 0 or 1 at Week 12
-----------------	---

End point description:

The IGSA score is an assessment of AD signs. Investigator assesses signs in 2 steps: Step 1: Lesional assessment: Investigator chooses the lesional grade that best describes the participant's involved skin, on average. Step 2: Consider Upgrade or Downgrade: based on skin lesion extent and location. Upgrade refers to the disease extends over the majority (>50% of a region) of one or more body regions, or is prominently affecting high visibility/functionally-important areas (face and hands). Downgrade refers to the disease localized to only one or two small areas (less than 1-2 palms) that are not highly visible or functionally important. A region is defined by i) arms combined, ii) legs combined, iii) trunk, and iv) head and neck, for a total of four regions. The IGSA utilizes a 5-point scale ranging from 0 (clear) to 5 (severe disease) where 0 = clear (no inflammatory signs of AD), 1 = almost clear, 2 = mild, 3 = moderate, 4 = severe AD. mITT population.

End point title	Percent Change From Baseline in Severity Scoring of Atopic Dermatitis (SCORAD) Index Score at Week 12
-----------------	---

End point description:

The SCORAD index scale combines 1) intensity of six lesion characteristics (erythema, edema/papulation, oozing/crusts, excoriations, lichenification, dryness) as assessed by the physician on a scale of 0 (absent) to 3 (severe) across four regions (head, trunk, upper and lower extremities); and 2) subjective symptoms of pruritus and sleep disturbance as reported by the participant on a visual analog scale (VAS) from 0 to 10 (increasing severity); along with 3) Physician assessment of affected areas (extent) in each region is made as percentage of body surface (head [10%], upper extremities [20%], trunk [30%], and lower extremities [40%]). The final SCORAD index score, ranging from 0 (absent disease) to 103 (severe disease), is calculated according to the weighted formula: $(0.2 \times \text{area}) + (3.5 \times [\text{sum of intensity score for each of the 6 items}]) + \text{participant's subjective score}$. mITT population. End point title	Absolute Change From Baseline in SCORAD Index Score at Week 12
-----------------	--

End point description:

The SCORAD index scale combines 1) intensity of six lesion characteristics (erythema, edema/papulation, oozing/crusts, excoriations, lichenification, dryness) as assessed by the physician on a scale of 0 (absent) to 3 (severe) across four regions (head, trunk, upper and lower extremities); and 2) subjective symptoms of pruritus and sleep disturbance as reported by the participant on a VAS from 0 to 10 (increasing severity); along with 3) Physician assessment of affected areas (extent) in each region is made as percentage of body surface (head [10%], upper extremities [20%], trunk [30%], and lower extremities [40%]). The final SCORAD index score, ranging from 0 (absent disease) to 103 (severe disease), is calculated according to the weighted formula: $(0.2 \times \text{area}) + (3.5 \times [\text{sum of intensity score for each of the 6 items}]) + \text{participant's subjective score}$. mITT population. Here, N=participants analysed for this outcome.

End point title	Percentage of Participants Who Achieved EASI-50 (50% Reduction From Baseline in EASI Score) at Week 12 and Maintained EASI-50 at Week 16
-----------------	--

End point description:

The EASI score was used to measure the severity and extent of AD and measures erythema, induration-papulation, excoriation and lichenification on a scale of 0 (none) to 3 (severe) on 4 anatomic regions of the body: head and neck, trunk, upper limbs, and lower limbs. Degree of involvement on each of the 4 anatomic regions is scored on a scale of 0 (no eruption) to 6 (> 90%-100% eruption). The total score is the sum of the four body-region scores, maximum=72, minimum=0, with higher scores reflecting greater disease severity. The total qualitative score is multiplied by the degree of involvement for each anatomic region and then multiplied by a constant and summed to yield the EASI score. mITT population. End point description:

IGSA score is an assessment of AD signs. Investigator assesses signs in 2 steps: Step 1: Lesional assessment: Investigator chooses lesional grade that best describes participant's involved skin, on average. Step 2: Consider Upgrade or Downgrade: based on skin lesion extent and location. Upgrade refers to disease extends over majority (>50% of a region) of one or more body regions, or is prominently affecting high visibility/functionally-important areas (face and hands). Downgrade refers to disease localized to only one or two small areas (less than 1-2 palms) that are not highly visible or functionally important. A region is defined by i) arms combined, ii) legs combined, iii) trunk, and iv) head and neck, for a total of four regions. IGSA utilizes a 5-point scale ranging from 0 (clear) to 5 (severe disease) where 0=clear (no inflammatory signs of AD), 1=almost clear, 2=mild, 3=moderate, 4=severe AD. mITT population. Secondary: Percentage of Participants Who Achieved IGSA Score of 0 or 1 at Week 12 and Maintained IGSA Score of 0 or 1 at Both Weeks 16 and 20

End point title	Percentage of Participants Who Achieved IGSA Score of 0 or 1 at Week 12 and Maintained IGSA Score of 0 or 1 at Both Weeks 16 and 20
-----------------	---

End point description:

IGSA score is an assessment of AD signs. Investigator assesses signs in 2 steps: Step 1: Lesional assessment: Investigator chooses lesional grade that best describes participant's involved skin, on average. Step 2: Consider Upgrade or Downgrade: based on skin lesion extent and location. Upgrade refers to disease extends over majority (>50% of a region) of one or more body regions, or is prominently affecting high visibility/functionally-important areas (face and hands). Downgrade refers to disease localized to only one or two small areas (less than 1-2 palms) that are not highly visible or functionally important. A region is defined by i) arms combined, ii) legs combined, iii) trunk, and iv) head and neck, for a total of four regions. IGSA utilizes a 5-point scale ranging from 0 (clear) to 5 (severe disease) where 0=clear (no inflammatory signs of AD), 1=almost clear, 2=mild, 3=moderate, 4=severe AD. mITT population. Here, N=participants who achieved IGSA score of 0 or 1 at Week 12.

The DLQI refers to the previous 7 days and questions are categorized into six domains: symptoms and feelings (2 items), daily activities (2 items), leisure (2 items), work and school (1 item), personal relationships (2 items), and treatment (1 item). The questions were assessed on a 4-point likert scale: 0 (not at all), 1 (a little), 2 (a lot), and 3 (very much). Scores of individual items were added to yield a total DLQI score (0-30), where higher scores mean greater impairment of the participant's health-related QoL. mITT population. Here, N=participants analysed for this outcome.

Reporting groups

Reporting group title	Lebrikizumab 250 mg Single Dose + TCS
-----------------------	---------------------------------------

Reporting group description:

Participants received a single dose of lebrikizumab 250 milligrams (mg) subcutaneous (SC) injection on Day 1 followed by placebo on Week 4 and Week 8. Participants continued to apply TCS cream (triamcenolone acetonide 0.1% or hydrocortisone 2.5% cream) twice daily to active skin lesions throughout the 12-week treatment period.

Reporting group title	Lebrikizumab 125 mg Single Dose + TCS
-----------------------	---------------------------------------

Reporting group description:

Participants received a single dose of lebrikizumab 125 mg SC injection on Day 1 followed by placebo on Week 4 and Week 8. Participants continued to apply TCS cream (triamcenolone acetonide 0.1% or hydrocortisone 2.5% cream) twice daily to active skin lesions throughout the 12-week treatment period.

Reporting group title	Lebrikizumab 125 mg Q4W + TCS
-----------------------	-------------------------------

Reporting group description:

Participants received lebrikizumab 125 mg SC injection every 4 weeks (Q4W) for a total of 3 doses. Participants continued to apply TCS cream (triamcenolone acetonide 0.1% or hydrocortisone 2.5% cream) twice daily to active skin lesions throughout the 12-week treatment period.

Reporting group title	Placebo Q4W + TCS Cream
-----------------------	-------------------------

Reporting group description:

Participants received placebo Q4W for a total of 3 doses. Participants continued to apply TCS cream (triamcenolone acetonide 0.1% or hydrocortisone 2.5% cream) twice daily to active skin lesions throughout the 12-week treatment period.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
16 January 2015	<ul style="list-style-type: none">- Antiviral medication to treat herpes zoster was deleted from the list of therapies permitted during the study.- Herpes zoster infection was added as a reason requiring study treatment discontinuation.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
