Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	31 October 2016
Is this the analysis of the primary completion data?	Yes
Primary completion date	30 October 2016
Global end of trial reached?	Yes
Global end of trial date	31 October 2016
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

To evaluate the efficacy, defined as time to response (where response is defined as a Clinical Global Impression of Improvement [CGI I] score of 1 ["Very much improved"] or 2 ["Much improved"]), of inhaled loxapine 9.1 mg as compared with aripiprazole 9.75 mg administered as an intramuscular (IM) injection in acutely agitated patients with schizophrenia or bipolar disorder.

Protection of trial subjects:

This study was conducted in compliance with Independent Ethics Committee and International Council of Harmonisation Good Clinical Practice Guidelines, in accordance with applicable regulations regarding clinical safety data management (E2A, E2B(R3)), European Community directives 2001/20, 2001/83, 2003/94, and 2005/28 as enacted into local law, and with ICH guidelines regarding scientific integrity (E4, E8, E9, and E10). In addition, this study adhered to all local regulatory requirements, and requirements for data protection.

Background therapy:

No background therapies were to be used by patients in both treatment groups.

The use of benzodiazepines or other hypnotics or oral or short-acting IM antipsychotics was not permitted within 4 hours (Protocol Versions 1.0, 2.0, and 3.0) or 1 hour (Protocol Versions 4.0 and 5.0) prior to study drug administration or during the study. The only exception was benzodiazepines when used as rescue medication, as described below.

If required, rescue medication could be used as per physician judgement and usual clinical practice and when dosed as clinically indicated. Rescue medication constituted 2 mg of IM or oral lorazepam (or an equivalent dose of other benzodiazepine). Unless medically required, rescue medication was not used until after:

- At least 2 hours post Dose 1
- 2-hour efficacy assessments had been completed
- Dose 2 of the study medication had been given
- At least 20 minutes had elapsed after the administration of study medication
- The corresponding evaluation had been performed.

Evidence for comparator:

Aripiprazole for IM injection was selected as the active comparator for use in this study. It is a recognised standard of care for the rapid control of agitation and disturbed behaviours in patients with schizophrenia or in patients with bipolar I disorder, when oral therapy is not available.

Actual start date of recruitment	02 December 2014
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Spain: 110
Country: Number of subjects enrolled	Czech Republic: 18

Country: Number of subjects enrolled	Germany: 1
Country: Number of subjects enrolled	Russian Federation: 230
Worldwide total number of subjects	359
EEA total number of subjects	129

Notes:

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	357
From 65 to 84 years	2
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

Patients were enrolled into the study from 02 December 2014 to 30 September 2016. A total of 23 centres in four countries enrolled a total of 359 patients: 18 patients at 4 centres in the Czech Republic; 1 patient at 1 centre in Germany; 230 patients at 9 centres in Russia; and 110 patients at 9 centres in Spain.

Pre-assignment

Screening details:

The Pre-treatment Period (included screening of up to 4 hours and baseline up to 30 minutes prior to the administration of initial study medication). A total of 372 patients were screened.

Pre-assignment period milestones

Number of subjects started	372 ^[1]
Number of subjects completed	359

Pre-assignment subject non-completion reasons

Reason: Number of subjects	Did not fulfill inclusion criterion 4: 1
Reason: Number of subjects	Did not fulfill inclusion criterion 3: 2
Reason: Number of subjects	Absence of study medication: 1
Reason: Number of subjects	Insufficient medication (aripiprazole): 1
Reason: Number of subjects	Lack of study medication: 1
Reason: Number of subjects	Lack of suitable medication: 1
Reason: Number of subjects	Patient withdrew consent prior to randomisation: 1
Reason: Number of subjects	Randomisation stopped by Sponsor: 1
Reason: Number of subjects	The system did not provide medication kits: 1
Reason: Number of subjects	Insufficient medication at centre to randomise: 2
Reason: Number of subjects	Fulfilled exclusion criterion 4: 1

Notes:

[1] - The number of subjects reported to have started the pre-assignment period are not the same as the worldwide number enrolled in the trial. It is expected that these numbers will be the same.

Justification: The pre-assignment period included all screened patients; 359 patients were randomized (period 1: Randomisation); 357 patients were randomized with informed consent (period 2: Baseline [FAS]).

Period 1

Period 1 title	Randomisation
Is this the baseline period?	No
Allocation method	Randomised - controlled
Blinding used	Single blind
Roles blinded	Assessor ^[2]

Blinding implementation details:

Inhaled loxapine and aripiprazole were administered open-label. Efficacy assessments (CGI-I and CGI of severity [CGI-S]) for the primary end point and Treatment Satisfaction for Medication Questionnaire (TSQM; Item 14) were performed by a trained blinded assessor. To maintain assessor blinding, a different staff member administered the study treatment. The assessor role was restricted to efficacy assessments. Patients were told not to tell the blinded assessor which treatment they received.

Arms

Are arms mutually exclusive?	Yes
------------------------------	-----

Arm title	Inhaled loxapine (Randomisation)
Arm description: This arm comprised patients randomised to receive inhaled loxapine 9.1 mg.	
Arm type	Experimental
Investigational medicinal product name	Inhaled loxapine
Investigational medicinal product code	ATC: N05AH01
Other name	Adasuve®
Pharmaceutical forms	Inhalation powder, pre-dispensed
Routes of administration	Inhalation use

Dosage and administration details:

The dose of inhaled loxapine was 9.1 mg. Patients randomised to inhaled loxapine received one or two doses of inhaled loxapine during the study; all patients randomised to inhaled loxapine were to receive Dose 1, and Dose 2, a pro re nata (PRN) dose, could be administered ≥ 2 hours after Dose 1 if agitation did not subside sufficiently after the first dose of study medication or in case of agitation recurrence.

Loxapine was administered by inhalation using a thermally-generated aerosol (Staccato delivery system). Loxapine was provided in a single-dose inhaler, packaged in a sealed pouch within a carton and had to remain in the original pouch until ready for use in order to protect from light and moisture.

Arm title	Aripiprazole (Randomisation)
Arm description: This arm comprised patients randomised to receive aripiprazole 9.75 mg.	
Arm type	Active comparator
Investigational medicinal product name	Aripiprazole
Investigational medicinal product code	ATC: N05AX12
Other name	Abilify®
Pharmaceutical forms	Solution for injection
Routes of administration	Intramuscular use

Dosage and administration details:

The dose of aripiprazole was 9.75 mg. Patients randomised to aripiprazole received one or two doses of IM aripiprazole during the study; all patients randomised to aripiprazole were to receive Dose 1, and Dose 2, a PRN dose, could be administered ≥ 2 hours after Dose 1 if agitation did not subside sufficiently after the first dose of study medication or in case of agitation recurrence.

Aripiprazole (Abilify®) was commercially available and was purchased directly from the supplier and supplied to sites by Almac. Aripiprazole solution for IM injection was provided in a vial and packaged within a carton. The vial containing aripiprazole had to be kept in the outer carton in order to protect it from light.

Notes:

[2] - The roles blinded appear inconsistent with a simple blinded trial.

Justification: This was an open-label assessor-blind, randomised, active control trial.

Number of subjects in period 1	Inhaled loxapine (Randomisation)	Aripiprazole (Randomisation)
Started	179	180
Completed	179	178
Not completed	0	2
Did not give informed consent	-	2

Period 2

Period 2 title	Baseline (FAS)
Is this the baseline period?	Yes ^[3]
Allocation method	Randomised - controlled
Blinding used	Single blind
Roles blinded	Assessor ^[4]

Blinding implementation details:

Inhaled loxapine and aripiprazole were supplied as open-label medication. The efficacy assessments (CGI-I and CGI-S) for the primary end point and Item 14 of the TSQM were performed by a blinded assessor trained on the protocol. In order to maintain assessor blinding, a different staff member administered the study treatment. The role of the assessor was restricted to the efficacy assessments. Patients were instructed not to tell the blinded assessor which treatment they received.

Arms

Are arms mutually exclusive?	Yes
Arm title	Inhaled loxapine (Baseline)

Arm description:

The inhaled loxapine Full Analysis Set (FAS) included all patients randomised to inhaled loxapine with informed consent, regardless of whether or not the patients went on to receive Dose 1. All efficacy analyses and all efficacy and baseline summaries were performed on the FAS. Patients in the FAS were categorised based on the treatment to which they were randomised, irrespective of the actual treatment received.

Arm type	Experimental
Investigational medicinal product name	Inhaled loxapine
Investigational medicinal product code	ATC: N05AH01
Other name	Adasuve®
Pharmaceutical forms	Inhalation powder, pre-dispensed
Routes of administration	Inhalation use

Dosage and administration details:

The dose of inhaled loxapine was 9.1 mg. Patients randomised to inhaled loxapine received one or two doses of inhaled loxapine during the study; all patients randomised to inhaled loxapine were to receive Dose 1, and Dose 2, a PRN dose, could be administered ≥ 2 hours after Dose 1 if agitation did not subside sufficiently after the first dose of study medication or in case of agitation recurrence.

Loxapine was administered by inhalation using a thermally-generated aerosol (Staccato delivery system). Loxapine was provided in a single-dose inhaler, packaged in a sealed pouch within a carton and had to remain in the original pouch until ready for use in order to protect from light and moisture.

Arm title	Aripiprazole (Baseline)
------------------	-------------------------

Arm description:

The aripiprazole FAS included all patients randomised to aripiprazole with informed consent, regardless of whether or not the patients went on to receive Dose 1. All efficacy analyses and all efficacy and baseline summaries were performed on the FAS. Patients in the FAS were categorised based on the treatment to which they were randomised, irrespective of the actual treatment received.

Arm type	Active comparator
Investigational medicinal product name	Aripiprazole
Investigational medicinal product code	ATC: N05AX12
Other name	Abilify®
Pharmaceutical forms	Solution for injection
Routes of administration	Intramuscular use

Dosage and administration details:

The dose of aripiprazole was 9.75 mg. Patients randomised to aripiprazole received one or two doses of IM aripiprazole during the study; all patients randomised to aripiprazole were to receive Dose 1, and Dose 2, a PRN dose, could be administered ≥ 2 hours after Dose 1 if agitation did not subside sufficiently after the first dose of study medication or in case of agitation recurrence.

Aripiprazole (Abilify®) was commercially available and was purchased directly from the supplier and supplied to sites by Almac. Aripiprazole solution for IM injection was provided in a vial and packaged within a carton. The vial containing aripiprazole had to be kept in the outer carton in order to protect it from light.

Notes:

[3] - Period 1 is not the baseline period. It is expected that period 1 will be the baseline period.

Justification: Period 1 (randomisation) included 2 patients randomised in the aripiprazole group who did not provide informed consent. The 2 patients did not receive treatment and they were not included in the analyses. Therefore, Period 1 was not considered the baseline period in this study.

[4] - The roles blinded appear inconsistent with a simple blinded trial.

Justification: This was an open-label assessor-blind, randomised, active control trial.

Number of subjects in period 2^[5]	Inhaled loxapine (Baseline)	Aripiprazole (Baseline)
Started	179	178
Completed	179	178

Notes:

[5] - The number of subjects reported to be in the baseline period are not the same as the worldwide number enrolled in the trial. It is expected that these numbers will be the same.

Justification: Baseline (FAS) includes all randomised patients who provided informed consent. There were 2 patients randomised in the aripiprazole group (and hence included in Period 1 [randomization]) who did not provide informed consent. The 2 patients are not included in the Baseline (FAS) period (Period 2).

Period 3

Period 3 title	Post-treatment Evaluation Period (FAS)
Is this the baseline period?	No
Allocation method	Randomised - controlled
Blinding used	Single blind
Roles blinded	Assessor ^[6]

Blinding implementation details:

Inhaled loxapine and aripiprazole were supplied as open-label medication. The efficacy assessment (CGI-I) for the primary end point and Item 14 of the TSQM were performed by a blinded assessor trained on the protocol. In order to maintain assessor blinding, a different staff member administered the study treatment. The role of the assessor was restricted to the efficacy assessments. Patients were instructed not to tell the blinded assessor which treatment they received.

Primary: Time to response, where response was defined as a CGI-I score of 1 ("Very much improved") or 2 ("Much improved")

End point title	Time to response, where response was defined as a CGI-I score of 1 ("Very much improved") or 2 ("Much improved")
-----------------	--

End point description:

The primary efficacy end point was the time from Dose 1 to response in minutes, where response was defined as a CGI I score of 1 ("Very much improved") or 2 ("Much improved"). CGI-I score was assessed at 10, 20, 30, 50, 60, 90 and 120 minutes post Dose 1. Patients without response within 2 hours were considered as non-responders and the "time to response" as 4 hours (2 more than the maximum follow up for this variable). The analysis of primary efficacy variables was performed by means of suitable descriptive analysis and the inferential analysis was performed by the Hodges-Lehmann approach based on the Wilcoxon log-rank (a.k.a Mann-Whitney).

End point type	Primary
----------------	---------

End point timeframe:

The primary end point was assessed at 10, 20, 30, 50, 60, 90 and 120 minutes post Dose 1 during the Post-treatment Evaluation Period.

End point values	Inhaled loxapine (FAS)	Aripiprazole (FAS)		
Subject group type	Reporting group	Reporting group		
Number of subjects analysed	179	178		
Units: Minutes				
median (confidence interval 95%)	50 (30 to 50)	60 (50 to 90)		

Attachments (see zip file)	Kaplan-Meier Plot of Time to CGI-I Response (FAS)
-----------------------------------	---

Statistical analyses

Statistical analysis title	Wilcoxon Log-Rank test
-----------------------------------	------------------------

Statistical analysis description:

The primary efficacy analysis was performed on the time to response for all patients in the FAS using a Wilcoxon rank-sum test. Patients who withdrew early from the study, or patients who completed the study through to 24 hours without meeting the response criteria, were censored at their last CGI I assessment time and classed as non-responders in the primary efficacy analysis.

Comparison groups	Inhaled loxapine (FAS) v Aripiprazole (FAS)
Number of subjects included in analysis	357
Analysis specification	Pre-specified
Analysis type	superiority ^[1]
P-value	= 0.0005
Method	Wilcoxon (Mann-Whitney)
Parameter estimate	Median difference (final values)
Point estimate	10

Confidence interval	
level	95 %
sides	2-sided
lower limit	0
upper limit	30

Notes:

[1] - The null hypothesis stated that there was no difference in time to response between inhaled loxapine and aripiprazole, with the alternative of a non-zero difference between groups. The primary treatment comparison was evaluated using a two-sided significance level of 0.05. The primary objective was met if the results of this analysis showed significant superiority, from a Wilcoxon rank-sum test, in the time to response of the inhaled loxapine versus aripiprazole groups over 2 hours.

Secondary: The proportion of responders, as defined by a CGI I score of 1 or 2 at 10, 20, 30, 50, 60, 90 and 120 minutes after the first dose of study drug administration

End point title	The proportion of responders, as defined by a CGI I score of 1 or 2 at 10, 20, 30, 50, 60, 90 and 120 minutes after the first dose of study drug administration
-----------------	---

End point description:

This end point comprised the:

- Percentage of responders by assessment timepoint: Percentage of responders out of all patients in the Full Analysis Set (FAS) at 10, 20, 30, 50, 60, 90 and 120 minutes post Dose 1, where response was defined as a CGI-I score of 1 ("Very much improved") or 2 ("Much improved").
- Percentage of cumulative responders by assessment timepoint: Percentage of cumulative responders out of all patients in the FAS at 10, 20, 30, 50, 60, 90 and 120 minutes post Dose 1, where response was defined as a CGI-I score of 1 ("Very much improved") or 2 ("Much improved").

Patients who did not record CGI-I information at any time point, or who did not meet the response criteria at any of the assessments, were classed as non-responders.

The numerators for the percentages are presented in the end point below.

End point type	Secondary
----------------	-----------

End point timeframe:

This secondary exploratory end point was assessed at 10, 20, 30, 50, 60, 90 and 120 minutes post-Dose 1.

End point values	Inhaled loxapine (FAS)	Aripiprazole (FAS)	Total (FAS)

Statistical analyses

Statistical analysis title	Chi-squared Test
----------------------------	------------------

Statistical analysis description:

Secondary inferential analyses were performed using two group Chi-squared tests and were exploratory in nature. All statistical tests were applied with a 0.05 two-sided significance level.

Comparison groups	Aripiprazole (FAS) v Inhaled loxapine (FAS)
-------------------	---

Number of subjects included in analysis	357
Analysis specification	Pre-specified
Analysis type	superiority
P-value	= 0.3249 ^[6]
Method	Chi-squared

Notes:

[6] - The proportions of patients in the inhaled loxapine and aripiprazole groups who received Dose 2 (12 [6.7%] vs 17 [9.6%] patients, respectively; p=0.3249) or rescue medication (1 [0.6%] vs 0 patients; p=0.3180) were not significantly different.

Secondary: Time to Dose 2 (PRN) of study medication and time to rescue medication during the Post-treatment Evaluation Period as compared between groups

End point title	Time to Dose 2 (PRN) of study medication and time to rescue medication during the Post-treatment Evaluation Period as compared between groups
-----------------	---

End point description:

These end points included:

- Time to Dose 2: Time from Dose 1 until administration of Dose 2.
- Time to rescue medication: Time from Dose 1 until administration of rescue medication.

The data for the time from Dose 1 until administration of Dose 2 are presented in the table below. Regarding the time to rescue medication, only 1 patient in the inhaled loxapine group received rescue medication. The time from Dose 1 until administration of rescue medication in this patient was 150.0 minutes.

End point type	Secondary
----------------	-----------

End point timeframe:

These secondary exploratory end points were assessed from the time that Dose 1 was administered to 24 hours after Dose 1 or the end of the agitation episode as per the Investigator's judgement, whichever occurred first.

Adverse events

Adverse events information

Timeframe for reporting adverse events:

AEs were monitored throughout the entire study and recorded for at least 4 hours and for a maximum of 24 hours after Dose 1 of the study medication or until the end of the agitation episode as per the Investigator's judgement, whichever occurred first.

Adverse event reporting additional description:

Each patient had to be carefully monitored for AEs. Investigators asked the patient at each timepoint specified in the Study Flow Chart if they had experienced any untoward effects since the last study timepoint. Patients were monitored for bronchospasm for ≥ 1 hour after Dose 1 and Dose 2 (if Dose 2 was administered).

Assessment type	Non-systematic

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
10 April 2015	<p>The purpose of this global protocol amendment (protocol Version 2.0) was to change the categories for assessing the relationship of any clinical adverse experiences to study medication from Related and Unrelated to Probable, Possible, Unlikely, and Not Related.</p> <p>It was also clarified that:</p> <ul style="list-style-type: none">• Suspected Unexpected Serious Adverse Reactions are serious adverse events (SAEs) that were judged by the Investigator or the Sponsor to be possibly or probably related to the study treatment administered and assessed by the Sponsor and/or its delegate as unexpected.• Any SAE that occurred outside of the reporting period, for which there was a reasonable possibility of a study drug relationship in the opinion of the Investigator, had to be reported as soon as the site became aware of the event.
05 August 2015	<p>The purpose of this global protocol amendment (protocol Version 3.0) was to facilitate patient recruitment into the study by:</p> <p>A) Removing the upper limit of agitation severity from the inclusion criterion: Therefore, any patients judged to be clinically agitated at Baseline with a value of ≥ 4 out of the 7 items on the CGI-S could be eligible for inclusion in the study. Previous pivotal clinical studies assessing the safety and efficacy of inhaled loxapine or aripiprazole in acutely agitated patients with schizophrenia or bipolar disorder did not specify an upper limit on agitation severity in the eligibility criteria. The eligibility criteria current at the time of the amendment already addressed certain considerations associated with the removal of the upper limit of agitation severity from the inclusion criterion and so limited the recruitment of patients who were most severely affected in a clinically meaningful manner: 1) patients recruited under the protocol amendment, regardless of the severity of their agitation, were required to have documented adequate consent capacity per the Investigator's judgement and to provide written informed consent (except in Spain); 2) the study was designed to ensure that any patients who were likely to be unable to use the inhalation device were excluded from the study.</p> <p>B) Removing the restriction of the use of injectable depot neuroleptics or long-acting second generation antipsychotics within 1 dose interval prior to study drug administration: This change was feasible as the efficacy and safety of the study drug to treat the acute agitation episode could be assessed in this pragmatic clinical study, regardless of the medication used to treat the underlying condition. Removing this eligibility criterion better reflected the clinical practice and standard of care (SOC) of acutely agitated patients with schizophrenia or bipolar disorder.</p>

15 March 2016	<p>The purpose of this global protocol amendment (protocol Version 4.0) was to facilitate patient recruitment into the study on one hand, and also to better reflect the usual clinical practice by changing the Exclusion Criterion 4. Patients were eligible for the study if they were not treated with benzodiazepines or other hypnotics or oral or short-acting IM antipsychotics within 1 hour prior to study drug administration, whereas the previous protocol version stated a 4-hour time interval.</p> <p>The effect of benzodiazepines or other hypnotics or oral or short-acting IM antipsychotics can be seen quite early after administration and, if patients were still judged to be clinically agitated 1 hour later, they were allowed to be enrolled into the study.</p> <p>This change was feasible as the efficacy and safety of the study drug to treat the acute agitation episode could be assessed in this pragmatic clinical study. Changing this eligibility criterion better reflected the clinical practice and SOC of acutely agitated patients with schizophrenia or bipolar disorder and enabled the enrolment of a subject population that is closer to the patient population in which inhaled loxapine and aripiprazole is being used in clinical practice.</p> <p>Other changes made in this protocol amendment included the extension of the planned duration of the clinical study from up to approximately 11 months to up to approximately 36 months.</p>
21 September 2016	<p>The purpose of this global protocol amendment was to update the statistical analysis methodology.</p> <p>The current trial characteristics (i.e., short time of follow-up and condition under study) would not lead to early study withdrawals. For this reason, the analysis planned initially (i.e., the Mantel-Haenszel log-rank test) would not represent any advantage over other standard methods. Therefore, the purpose of this amendment was to document the use of the Wilcoxon rank-sum test, instead of the Mantel-Haenszel log-rank test, to assess the primary efficacy analysis. Additionally, the original analysis (i.e., the Mantel-Haenszel log-rank test) would also be conducted for sensitivity purposes. The inferential analysis was also conducted using the stratified non-parametric van Elteren test, using modified ridit scores, which is as a direct extension of the Wilcoxon rank-sum test for two samples.</p> <p>Other changes made in this global protocol amendment were to:</p> <ul style="list-style-type: none"> • Confirm that the assessment of the initial sample size estimation would be based on the interim analysis, Stage 1 data of the primary end point of time to response of CGI-I and would be used as estimates in a calculation of the sample size at one-sided 0.025 alpha level and approximately 90% power • Clarify that there would be no adjustment for multiplicity upon the stated alpha level for this study • Clarify that meaningful time (difference between median aripiprazole time to response and median loxapine time to response) was approximately 30 minutes (interim analysis) • Update some administrative information (change in Medical Monitor, Monitoring Committee constitution, Biostatistician)

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

The results of the study are applicable to the clinical trial population, which may not be fully representative of the population of patients treated in clinical practice.
