### Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

## Results analysis stage

Analysis stage	Final
Date of interim/final analysis	08 January 2018
Is this the analysis of the primary completion data?	Yes
Primary completion date	20 April 2017
Global end of trial reached?	Yes
Global end of trial date	23 October 2017
Was the trial ended prematurely?	No

Notes:

## General information about the trial

Main objective of the trial:

The objective of this study was to assess the efficacy, safety, tolerability and pharmacokinetics (PK) of once daily oral doses of Empagliflozin 10 milligram (mg) and 25 mg compared with placebo in patients with type 1 diabetes mellitus (T1DM) as adjunctive to optimised insulin therapy.

Protection of trial subjects:

Only patients that met all the study inclusion and none of the exclusion criteria were to be randomised in the study. All patients were free to withdraw from the clinical trial at any time for any reason given. Close monitoring of all patients was adhered to throughout the trial conduct.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	02 July 2015
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

## Population of trial subjects

Worldwide total number of subjects	1338
EEA total number of subjects	714

Notes:

<b>Subjects enrolled per age group</b>	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	1228
From 65 to 84 years	110
85 years and over	0

## Subject disposition

### Recruitment

Recruitment details:

Randomised, double-blind, placebo-controlled, parallel group, 52-week trial comparing 2 oral once daily doses (10 mg and 25 mg) of empagliflozin with placebo in patients with type 1 diabetes mellitus (T1DM), each as adjunctive to optimised insulin therapy. A total of 1338 screened, 730 randomised/treated.

### Pre-assignment

Screening details:

6-week T1DM therapy (insulin) optimisation period followed by a 2-week placebo run-in period before randomisation. Patients who successfully completed both of the periods were randomised into the 52-week double-blind treatment period. All treatments were administered in addition to optimised insulin therapy.

### Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Monitor, Data analyst

Blinding implementation details:

This is randomised and controlled trial.

### Arms

Are arms mutually exclusive?	Yes
<b>Arm title</b>	Placebo matching Empagliflozin

Arm description:

Patients administered placebo matching empagliflozin film-coated tablet orally once daily as adjunctive to optimised insulin therapy for 52 weeks

Arm type	Placebo
Investigational medicinal product name	Placebo matching Empagliflozin
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Film-coated tablet
Routes of administration	Oral use

Dosage and administration details:

matching Empagliflozin dosage once daily

<b>Arm title</b>	Empagliflozin 10 mg
------------------	---------------------

Arm description:

Patients administered empagliflozin 10 mg film-coated tablet orally once daily as adjunctive to optimised insulin therapy for 52 weeks.

Arm type	Experimental
Investigational medicinal product name	Empagliflozin
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Film-coated tablet
Routes of administration	Oral use

Dosage and administration details:

10 mg once daily

<b>Arm title</b>	Empagliflozin 25 mg
------------------	---------------------

Arm description:

Patients administered empagliflozin 25 mg film-coated tablet orally once daily as adjunctive to optimised

insulin therapy for 52 weeks.

Arm type	Experimental
Investigational medicinal product name	Empagliflozin
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Film-coated tablet
Routes of administration	Oral use

Dosage and administration details:

25 mg once daily

<b>Number of subjects in period 1<sup>[1]</sup></b>	Placebo matching Empagliflozin	Empagliflozin 10 mg	Empagliflozin 25 mg
Started	243	243	244
Completed	211	223	230
Not completed	32	20	14
Consent withdrawn by subject	5	3	5
Adverse event, non-fatal	6	6	3
Other than specified	4	4	5
Lost to follow-up	7	4	-
Protocol deviation	10	3	1

Notes:

[1] - The number of subjects reported to be in the baseline period are not the same as the worldwide number enrolled in the trial. It is expected that these numbers will be the same.

Justification: Baseline characteristics are based on the patients who were randomised after successfully completing the screening period.

.

Reporting group description: Patients administered empagliflozin 10 mg film-coated tablet orally once daily as adjunctive to optimised insulin therapy for 52 weeks.	
Reporting group title	Empagliflozin 25 mg
Reporting group description: Patients administered empagliflozin 25 mg film-coated tablet orally once daily as adjunctive to optimised insulin therapy for 52 weeks.	

### Primary: Change from baseline in glycated haemoglobin (HbA1c) at Week 26

End point title	Change from baseline in glycated haemoglobin (HbA1c) at Week 26
End point description: Change from baseline in glycated haemoglobin (HbA1c) for full analysis set (FAS) (observed cases [OC]) is presented. With regards to efficacy and safety endpoints, the term 'baseline' referred to the last observed measurement prior to administration of any randomised trial medication. Least squares mean is adjusted mean change from baseline. Restricted maximum likelihood estimation based on mixed-effect model for repeated measures (MMRM) analysis was used to obtain adjusted means for the treatment effects.  Full analysis set (FAS) (observed cases [OC]): Patients in the Treated Set (TS) who had a baseline and at least 1 on-treatment HbA1c measurement; the FAS was the basis for the primary efficacy analysis	
End point type	Primary

## Adverse events

### Adverse events information

Timeframe for reporting adverse events:

From the first dose of trial medication until 7 days after last in-take of trial medication, up to 422 days

Adverse event reporting additional description:

Treated set (TS): all patients who were treated with at least one dose of randomised trial medication; the TS was the basis for safety analyses. The total number of participants at risk is based on treated set.

Assessment type	Systematic
-----------------	------------

## More information

### Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
12 April 2016	Amendment 1 was implemented when 385 patients (about half of all randomised) had been randomised. The main effect of this amendment was to clarify the eligibility criteria, which were made consistent with the other pivotal trial 1245.72. The amendment also introduced additional blood ketone measurements for improved safety monitoring. Insulin titration was clarified and optimised: in the original clinical trial protocol (CTP) investigators were advised to reduce the total insulin dose by 10% regardless of HbA1c values. The amendment maintained this advice for patients with glycated haemoglobin (HbA1c) of 7.5 to <8%, and advised investigators to adjust the total insulin dose based on need for patients with HbA1c of ≥8%. Furthermore, the amendment introduced more details on the hierarchical testing procedure, based on regulatory feedback. The inclusion and exclusion criteria were modified for the purpose of safety, clarification, and for alignment with the trial 1245.72.
04 January 2017	Amendment 2 was implemented when all patients had been randomised. The main effect of this amendment was to introduce 2 continuous glucose monitoring (CGM)-related endpoints as key secondary endpoints, given that sodium-glucose co-transporter (SGLT-2)inhibitor treatment in T1DM may improve the burden of glycaemic variability, which remains a fundamental treatment challenge in the management of this disease. Accordingly, the hierarchical testing procedure was revised to accommodate the added confirmatory endpoints based on CGM. Events involving lower-limb amputation were added as an adverse event of special interest (AESI) to meet new regulatory requirements. The inclusion criteria were modified with regard to the definition of women of child-bearing potential. In addition, the removal of patients from the trial was modified with regard to concomitant medications.

Notes:

---

### Interruptions (globally)

Were there any global interruptions to the trial? No

### Limitations and caveats

None reported
