Subject disposition

Recruitment

Recruitment details:

This study was conducted at 417 sites in 41 countries worldwide. 2060 patients were enrolled in the open-label extension (OLE), out of which 1979 completed the screening phase. The number of patients included in the safety set was 1980 instead of 1979 due to the study drug administration records in the database.

Pre-assignment

Screening details:

The enrollment number in the protocol section (2007) reflects the number of participants as per the Novartis Clinical Trial Management System (CTMS). The total number in the participant flow and baseline characteristics sections reflects the number of participants enrolled/treated (1980).

End point description:

The primary assessments for safety were the reporting of angioedema, AEs suspected to be related to LCZ696, AEs leading to study drug discontinuation and serious adverse events (SAE) including death. The assessment of safety were based primarily on the frequency of adverse events of special interest, sitting systolic and diastolic blood pressure, heart rate, and serious adverse events suspected by the investigators to be related to LCZ696 for the Safety set. Only descriptive analysis done.
