

Clinical trial results:

Phase I/II open label, dose escalation trial to determine the MTD, safety, PK and efficacy of afatinib monotherapy in children aged 1 year to <18 years with recurrent/refractory neuroectodermal tumours, rhabdomyosarcoma and/or other solid tumours with known ErbB pathway deregulation regardless of tumour histology

| Is this the analysis of the primary completion data? | Yes |
| Primary completion date | 05 August 2020 |
| Global end of trial reached? | Yes |
| Global end of trial date | 05 August 2020 |
| Was the trial ended prematurely? | No |

Notes:

General information about the trial

Main objective of the trial:

The objective of the Phase I dose finding part was to determine the maximum tolerated dose (MTD), safety, and pharmacokinetics of afatinib in paediatric patients across all applicable tumour entities. The objective of the MTD expansion cohorts/Phase II part was to assess anti-tumour activity, safety, and pharmacokinetics of afatinib in a larger number of patients.

Protection of trial subjects:

Prior to the initiation of any trial-related procedure, all patients' parents/legally accepted representatives were informed about the trial verbally and in writing by the investigator. The parents/legally accepted representatives were allowed sufficient time to consider participation in the trial and to ask questions concerning the details of the trial. Because a high rate of screening failures was expected for the MTD expansion cohorts/Phase II part, a pre-screening informed consent was allowed to be used to enable collection and testing of tumour tissue for ErbB deregulations. Upon confirmation of positivity for selection biomarkers and before proceeding with trial procedures, the informed consent/assent for trial entry had to be signed. The patient's parents/legally accepted representatives and (where applicable) the patient were informed that they were free to withdraw their consent at any time during the trial without penalty or prejudice. They were informed that the patient's personal trial-related data would be considered confidential and used by BI in accordance with the local data protection laws. The level of disclosure was explained to the parents/legally accepted representatives. The 397 enrolled participants in age category of "In Utero" was actually with age missing.

Subject disposition

Recruitment

Recruitment details:

Phase I/II open label, dose escalation trial to determine the MTD, safety, PK and efficacy of afatinib monotherapy in children aged ≥ 1 year to < 18 years with recurrent/refractory neuroectodermal tumours, rhabdomyosarcoma and/or other solid tumours with known ErbB pathway deregulation regardless of tumour histology.

Pre-assignment

Screening details:

Only subjects that met all the study inclusion and none of the exclusion criteria were to be entered in the study. All subjects were free to withdraw from the clinical trial at any time for any reason given. Close monitoring of all subjects was adhered to throughout the trial conduct. Rescue medication was allowed for all patients as required.

Period 1

| | |
|------------------------------|--------------------------------|
| Period 1 title | Overall Study (overall period) |
| Is this the baseline period? | Yes |
| Allocation method | Randomised - controlled |
| Blinding used | Not blinded |

Blinding implementation details:

This study is open label

Arms

| | |
|------------------------------|------------------------|
| Are arms mutually exclusive? | Yes |
| Arm title | Dose finding - level 0 |

Arm description:

Afatinib, dose level 0. (Once daily at 80% of the recommended adult dose per m² body surface area using allometric scaling): Oral solid single-unit film-coated tablets for pediatric patients who are able to swallow them. Oral liquid formulation for patients who cannot swallow the film-coated tablets, or for doses which cannot be achieved by the film-coated tablets, or for pediatric patients who did not accept the film-coated tablets. Therapy with afatinib continued as long as the individual patient benefited from the therapy, did not develop secondary malignancy, and did not meet one of the criteria requiring withdrawal from treatment. Afatinib in film-coated tablet form can be given in tablets of 20, 30, 40 and 50 milligram (mg). The tablet dose is related to the free base equivalent to afatinib. The dose of afatinib as capsule and solvent for oral solution is given as a 200 mg capsule to be dissolved in aqueous solvent (2 capsules per 100 milliliter (ml) solvent) i.e. 4 mg per ml.

| | |

Notes:

[1] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: This endpoint was evaluated only descriptively. Thus, no statistical hypothesis were tested.

[2] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period.

Justification: Only those arms for which the comparisons are presented in the clinical trial report thus, those that would yield meaningful results were reported.

Primary: Number of participants with objective response - maximum tolerated dose (MTD) expansion cohort

| | |
|-----------------|--|
| End point title | Number of participants with objective response - maximum tolerated dose (MTD) expansion cohort ^{[5][6]} |
|-----------------|--|

End point description:

Number of participants with objective response in maximum tolerated dose (MTD) expansion cohort was reported. The objective response was defined as a best overall response of complete response or partial response based on investigator's assessment according to the institutional response evaluation criteria for the given tumour type, assessed every 8 weeks until progression. Treated set (TS): This patient set included all patients enrolled in the trial who were documented to have taken at least one dose of study medication.

| | |
|----------------|---------|
| End point type | Primary |
|----------------|---------|

End point timeframe:

Assessed every 8 weeks until progression of disease, up to 336 days.

Notes:

[5] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: This endpoint was evaluated only descriptively. Thus, no statistical hypothesis were tested.

[6] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period.

Justification: Only those arms for which the comparisons are presented in the clinical trial report thus, those that would yield meaningful results were reported.

Secondary: Progression free survival - maximum tolerated dose (MTD) expansion cohort

| | |
|-----------------|---|
| End point title | Progression free survival - maximum tolerated dose (MTD) expansion cohort ^[11] |
|-----------------|---|

End point description:

Progression free survival for maximum tolerated dose (MTD) expansion cohort was reported. Progression free survival (PFS) was defined as the duration from the date of first treatment until the date of the first documented progression or death due to any cause. If a patient did not have an event, PFS was censored at the date of last adequate tumour assessment. Median PFS was estimated by Kaplan-Meier. Treated set (TS) This patient set included all patients enrolled in the trial who were documented to have taken at least one dose of study medication.

| Reporting group title | Dose finding Level 0 |
|-----------------------|----------------------|

Reporting group description:

Afatinib, dose level 0. (Once daily at 80% of the recommended adult dose per m² body surface area using allometric scaling): Oral solid single-unit film-coated tablets for pediatric patients who are able to swallow them. Oral liquid formulation for patients who cannot swallow the film-coated tablets, or for doses which cannot be achieved by the film-coated tablets, or for pediatric patients who did not accept the film-coated tablets. Therapy with afatinib continued as long as the individual patient benefited from the therapy, did not develop secondary malignancy, and did not meet one of the criteria requiring withdrawal from treatment. Afatinib in film-coated tablet form can be given in tablets of 20, 30, 40 and 50 milligram (mg). The tablet dose is related to the free base equivalent to afatinib. The dose of afatinib as capsule and solvent for oral solution is given as a 200 mg capsule to be dissolved in aqueous solvent (2 capsules per 100 milliliter (ml) solvent) i.e. 4 mg per ml.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

| Date | Amendment |
|----------------|---|
| 04 May 2015 | Addition of optional cerebrospinal fluid PK sampling: Assess afatinib penetration into the cerebrospinal fluid / Implemented only after approval of the IRB/IEC/ Competent Authorities. Addition of details on handling of strong P-gp inhibitors/ inducers: Assure that MTD determination was not affected by the use of strong P-gp inhibitors or inducers / Implemented without IRB/IEC/Competent Authority approval as changes involved logistical or administrative aspects only. |
| 18 August 2016 | Clarifications, e.g. regarding the possible use of a pre-screening informed consent for the collection and testing of tumour tissue sample and collection of tumour images during the screening period. |
| 02 June 2017 | Change from Phase I trial to adaptive Phase I/II design, clarification of pre-screening informed consent use and alternative PK samplings. To comply with the Written Request received from FDA and to follow the contraception guidance per ICH M3 (R2)2 and HMA CTFG / Implemented only after approval of the IRB/IEC/ Competent Authorities |

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
