

Clinical trial results:

An Open-Label, Multicenter Study With an Extension Phase to Evaluate the Safety, Tolerability, and Exposure-Efficacy Relationship of Perampanel Oral Suspension When Administered as an Adjunctive Therapy in Pediatric Subjects (Age 4 to Less Than 12 Years) With Inadequately Controlled Partial-Onset Seizures or Primary Generalized Tonic-Clonic Seizures

Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

This is an open-label, multicenter study with an Extension Phase to evaluate the safety and tolerability of perampanel oral suspension when administered as an adjunctive therapy in children (ages 4 to less than [$<$] 12 years) with inadequately controlled partial onset seizures (POS) or primary generalized tonic clonic (PGTC) seizures.

Protection of trial subjects:

This study was conducted in accordance with standard operating procedures (SOPs) of the sponsor (or designee), which are designed to ensure adherence to Good Clinical Practice (GCP) guidelines as required by the following: - Principles of the World Medical Association Declaration of Helsinki (World Medical Association, 2008) - International Council on Harmonisation (ICH) E6 Guideline for GCP (CPMP/ICH/135/95) of the European Agency for the Evaluation of Medicinal Products, Committee for Proprietary Medicinal Products, International Council for Harmonisation of Technical Requirements for Registration of Pharmaceuticals for Human Use - Title 21 of the United States (US) Code of Federal Regulations (US 21 CFR) regarding clinical studies, including Part 50 and Part 56 concerning informed subject consent and Institutional Review Board (IRB) regulations and applicable sections of US 21 CFR Part 312 - European Good Clinical Practice Directive 2005/28/EC and Clinical Trial Directive 2001/20/EC for studies conducted within any European Union (EU) country. All suspected unexpected serious adverse reactions were reported, as required, to the Competent Authorities of all involved EU member states. - Article 14, Paragraph 3, and Article 80-2 of the Pharmaceutical Affairs Law (Law No. 145, 1960) for studies conducted in Japan, in addition to Japan's GCP Subject Information and Informed Consent.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	16 November 2016
Long term follow-up planned	Yes
Long term follow-up rationale	Safety
Long term follow-up duration	1 Months
Independent data monitoring committee (IDMC) involvement?	Yes

Worldwide total number of subjects	180
EEA total number of subjects	77

Notes:

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	180
Adolescents (12-17 years)	0
Adults (18-64 years)	0
From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

Subjects took part at 58 sites in the United States, European Union, Asia Pacific. 208 subjects were screened/enrolled. Of which 28 screen failures and 180 received treatment in Core Phase. Of 146 who completed Core Phase, 136 entered Extension Phase A. Of 122 who completed Extension Phase A, 42 entered Extension Phase B and 41 received treatment.

Pre-assignment

Screening details:

This study included a Core Phase and two Extension Phases (Extension Phase A and Extension Phase B).

Period 1

Period 1 title	Core Phase (up to 23 weeks)
Is this the baseline period?	Yes
Allocation method	Not applicable
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
Arm title	Perampanel 0.5 mg/mL: POS

Arm description:

Core Phase: Subjects with partial onset-seizures (POS) received perampanel 0.5 milligrams per milliliter (mg/mL) oral suspension titrated beyond 8 milligram per day (mg/day) up to 12 mg/day, if 8 mg/day was tolerable and were deemed likely to be benefitted by higher dose (for subjects who are not taking any enzyme-inducing antiepileptic drug [EIAED]), or titrated beyond 12 mg/day up to 16 mg/day, if 12 mg/day was tolerable and were deemed likely to be benefitted by higher dose (for subjects who are taking any EIAED). Dose titration- up to 11 weeks to identify each subject's optimum dose. Subjects then continued to take perampanel once daily at optimal dose level as a maintenance dose for up to 12 weeks. Extension Phase A: Subjects who completed Core Phase, entered Extension Phase A, and continued with their optimal perampanel dose from Core Phase for up to 29 weeks. Total duration of treatment for Core Phase and Extension Phase A was up to 52 weeks.

Arm type	Experimental
Investigational medicinal product name	Perampanel
Investigational medicinal product code	
Other name	E2007
Pharmaceutical forms	Oral drops, suspension
Routes of administration	Oral use

Dosage and administration details:

Perampanel 0.5 mg/mL oral suspension

Arm title	Perampanel 0.5 mg/mL: PGTC Seizures
------------------	-------------------------------------

Arm description:

Core Phase: Subjects with primary generalized tonic clonic (PGTC) seizures received perampanel 0.5 mg/mL oral suspension titrated beyond 8 mg/day up to 12 mg/day, if 8 mg/day was tolerable and were deemed likely to be benefitted by higher dose (for subjects who are not taking any other EIAED), or titrated beyond 12 mg/day up to 16 mg/day, if 12 mg/day was tolerable and were deemed likely to be benefitted by higher dose (for subjects who are taking any EIAED). Dose titration- up to 11 weeks to identify each subject's optimum dose. Subjects then continued to take perampanel oral suspension once daily at the optimal dose level as a maintenance dose for up to 12 weeks. Extension Phase A: Subjects who completed the Core Phase, entered the Extension Phase A, and continued with their optimal perampanel dose from Core Phase for up to 29 weeks. Total duration of treatment for Core Phase and Extension Phase A was up to 52 weeks.

Secondary: Model Predicted Percent Change in Average Seizure Frequency Over 28 Days During Maintenance Period in Core Phase of This Study From Baseline- Assessed as Relationship With Average Steady State Plasma Concentration (Cav, ss) of Perampanel (518 ng/mL)

End point title	Model Predicted Percent Change in Average Seizure Frequency Over 28 Days During Maintenance Period in Core Phase of This Study From Baseline- Assessed as Relationship With Average Steady State Plasma Concentration (Cav, ss) of Perampanel (518 ng/mL)
-----------------	---

End point description:

Seizure frequency was derived from information recorded in subject diary. Seizure frequency per 28 days calculated as number of seizures divided by number of days in the interval and multiplied by 28. Due to sparse pharmacokinetic (PK) sampling, data of OM was analyzed by pooling data from other Phase II/III studies of perampanel along with data of current study, subjects with POS or PGTC. Only data for subjects taking perampanel 8 mg/day (Cav, ss of 518 ng/mL) were reported. Subjects taking perampanel 12 mg/day in the studies from which data were pooled, were not included in analysis. ng/mL refers to nanogram per milliliter. Data for this OM was calculated through model prediction. All subjects who received perampanel who have seizure frequency, cognition, or AE data with documented dosing history. Population for this OM included subjects from other studies as well subjects from current study. Here "number of subject analyzed" signifies subjects evaluable for this measure.

Secondary: Change From Baseline in Aldenkamp-Baker Neuropsychological Assessment Schedule (ABNAS) Score at Week 23 (Core Phase) and at Week 52 (Extension Phase A) of This Study

End point title	Change From Baseline in Aldenkamp-Baker Neuropsychological Assessment Schedule (ABNAS) Score at Week 23 (Core Phase) and at Week 52 (Extension Phase A) of This Study
-----------------	---

End point description:

The ABNAS assessment measured 5 aspects of cognitive function such as fatigue, memory, concentration, motor speed, and reading. The assessment was a measure of subject-perceived cognitive effects of AEDs. This instrument was aimed at assessing subject perceived drug-related cognitive impairment. Total score ranged from 0-72. Higher scores indicate a worsening of these cognitive functions. SAS included all subjects who received at least 1 dose of study drug and had at least 1 postdose safety assessment.

End point title	Change From Baseline in Total Child Behavior Check List (CBCL) Score (Age Group 1.5 to 5 Years) at Week 23 (Core Phase) and at Week 52 (Extension Phase A) of This Study
-----------------	--

End point description:

The CBCL for subjects (age group 1.5 to 5 years) is a questionnaire to assess behavioral and emotional problems in children as reported by the primary caregiver for the following domains activities: emotionally reactive, anxious/depressed, withdrawn, somatic complaints, internalizing, attention problems, aggressive behavior, externalizing, sleep problems. CBCL total score for subjects (age group 1.5 to 5 years) ranged from 0 to 200, was calculated by adding individual score of each domain. Higher scores indicate greater problems in child behavior. SAS included all subjects who received at least 1 dose of study drug and had at least 1 postdose safety assessment. Here "number of subjects analyzed" signifies subjects who were evaluable for this OM and '99999' indicates that standard deviation could not be estimated for single subject for the specified arm.

Secondary: Change From Baseline in Time to Complete Lafayette Grooved Pegboard Test (LGPT) Scores for 8 Years and Under at Week 23 (Core Phase) and at Week 52 (Extension Phase A) of This Study

End point title	Change From Baseline in Time to Complete Lafayette Grooved Pegboard Test (LGPT) Scores for 8 Years and Under at Week 23
-----------------	---

End point description:

LGPT test measured visuomotor skills. This test was a manipulative dexterity test that consisted of a metal matrix of 25 holes with randomly positioned slots. The subject was required to insert 10 grooved pegs into the holes. The task was completed once for each hand; firstly, using the dominant hand followed by the non-dominant hand. The task was timed and the scores were the time taken for the subject to complete all 10 pegs for each hand. If the test cannot be completed within 300 seconds, 300 seconds were recorded for the time. An increase in score (longer time) indicated worsening of visuomotor skills. The time to complete test is presented as mean seconds plus/minus (+/-) SD. SAS included all subjects who received at least 1 dose of study drug and had at least 1 postdose safety assessment. Here "number of subject analyzed" signifies subject who were evaluable for this OM and CFB indicates change from baseline.

Secondary: Percentage of Subjects Based on 50% Responder Rate- Core Phase and Extension Phase A of This Study

End point title	Percentage of Subjects Based on 50% Responder Rate- Core Phase and Extension Phase A of This Study
-----------------	--

End point description:

A 50% responder was a subject who experienced a 50% or greater reduction in seizure frequency per 28 days from baseline. Total POS: sum of all POS including simple partial seizures without motor signs, simple partial seizures with motor signs, complex partial seizures, and complex partial seizures with SG. Data for this OM has been reported for 13 week time periods as per age groups. FAS included subjects who received at least 1 dose of study drug and had at least 1 postdose primary efficacy measurement.

End point type	Secondary

Secondary: Percentage of Subjects With Clinical Global Impression of Change Scores (CGIC)- Core Phase and Extension Phase A of This Study

End point title	Percentage of Subjects With Clinical Global Impression of Change Scores (CGIC)- Core Phase and Extension Phase A of This Study
-----------------	--

End point description:

Assessment of disease severity utilized the CGIC scale at end of treatment to evaluate subject's change in disease status from baseline. The CGIC is a 7-point scale that measures a physician's global impression of a subject's clinical condition. Scale ranged from 1 to 7 with lower score indicated improvement (1=very much improved, 2=much improved, 3=minimally improved), higher score indicated worsening (5=minimally worse, 6= much worse, 7=very much worse), and a score of 4 indicated no change. FAS included subjects who received at least 1 dose of study drug and had at least 1 postdose primary efficacy measurement.

Reporting groups

Reporting group title	Perampanel 0.5 mg/mL: POS
-----------------------	---------------------------

Reporting group description:

Core Phase: Subjects with POS received perampanel 0.5 mg/mL oral suspension titrated beyond 8 mg/day up to 12 mg/day, if 8 mg/day was tolerable and were deemed likely to be benefitted by higher dose (for subjects who are not taking any EIAED), or titrated beyond 12 mg/day up to 16 mg/day, if 12 mg/day was tolerable and were deemed likely to be benefitted by higher dose (for subjects who are taking any EIAED). Dose titration- up to 11 weeks to identify each subject's optimum dose. Subjects then continued to take perampanel once daily at optimal dose level as a maintenance dose for up to 12 weeks. Extension Phase A: Subjects who completed Core Phase, entered Extension Phase A, and continued with their optimal perampanel dose from Core Phase for up to 29 weeks. Total duration of treatment for Core Phase and Extension Phase A was up to 52 weeks.

Reporting group title	Extension B: Perampanel 0.5 mg/mL: PGTC Seizures
-----------------------	--

Reporting group description:

Subjects who completed Core Phase and Extension Phase A entered Extension Phase B, and continued with their optimal perampanel dose from Core Phase until a subject reached 12 years of age, switched to the commercial perampanel product, or discontinued for safety or administrative reasons.

Reporting group title	Extension B: Perampanel 0.5 mg/mL: POS
-----------------------	--

Reporting group description:

Subjects who completed Core Phase and Extension Phase A entered Extension Phase B, and continued with their optimal perampanel dose from Core Phase until a subject reached 12 years of age, switched to the commercial perampanel product, or discontinued for safety or administrative reasons.

Reporting group title	Perampanel 0.5 mg/mL: PGTC Seizures
-----------------------	-------------------------------------

Reporting group description:

Core Phase: Subjects with PGTC seizures received perampanel 0.5 mg/mL oral suspension titrated beyond 8 mg/day up to 12 mg/day, if 8 mg/day was tolerable and were deemed likely to be benefitted by higher dose (for subjects who are not taking any other EIAED), or titrated beyond 12 mg/day up to 16 mg/day, if 12 mg/day was tolerable and were deemed likely to be benefitted by higher dose (for subjects who are taking any EIAED). Dose titration- up to 11 weeks to identify each subject's optimum dose. Subjects then continued to take perampanel oral suspension once daily at the optimal dose level as a maintenance dose for up to 12 weeks. Extension Phase A: Subjects who completed the Core Phase, entered the Extension Phase A, and continued with their optimal perampanel dose from Core Phase for up to 29 weeks. Total duration of treatment for Core Phase and Extension Phase A was up to 52 weeks.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
20 April 2017	Amendment 01: Added that the Titration Period is a fixed duration of 11 weeks and subjects will remain on their optimum dose once it is achieved during this period. Separated the Titration Period dosing schedule into separate presentations for Global sites and Japan sites. Increased the time prior to Visit 2 that subjects must meet the prior seizure criterion from 4 to 12 weeks. Increased the number of approved antiepileptic drug (AEDs) subjects may currently be receiving from 2 to 3. Added exclusion criterion for cannabinoids. Added exclusion of subjects with hereditary problems of galactose intolerance, the Lapp lactase deficiency or glucose-galactose malabsorption. Added emphasis that efforts should be made to perform all clinical laboratory and screening tests on the scheduled day, or as close as possible to that day, within 4 week period prior Visit 2. Added emphasis that efforts should be made to perform all clinical laboratory and screening tests on the scheduled day, or as close as possible to that day, within 4 week period prior Visit 2. Added mandatory blood collection for pharmacokinetic (PK) assessment. Revised study visit window to ± 7 days of the scheduled visit. Grammatical, typographical, and formatting changes were also made.
19 October 2017	Amendment 02: Revised the Pretreatment Screening/Baseline Period (outside of Japan) to allow subjects to enrol sooner after a qualifying seizure, while maintaining the 4 weeks ± 3 days required in Japan. Added that the study period durations were "up to" the specified nominal times. Added that analyses for regional submissions may be performed during the course of the study. Revised the sample size to state "at least" 160 subjects "(with up to 40 subjects with PGTC and the balance with POS)". Added that each study visit is based on the actual prior visit (eg, Visit 3 is completed 2 weeks ± 3 days of Visit 2, Visit 4 is completed 3 weeks ± 3 days of Visit 3, etc). Revised study visit window during the Extension Phase back to ± 6 days of the scheduled visit for Visits 10 through 12 (as per the original protocol). Grammatical, typographical, and formatting changes were also made.
19 January 2018	Amendment 03: Clarified, in the text, that the Followup Visit would be conducted at 4 weeks ± 7 days after the last dose of study drug for all subjects, except for subjects entering into Extension A. Clarified, in the text, that the follow-up period of Extension A was only for subjects not entering into Extension B and that Extension B will occur in Japan only. Clarified, in the text, that a follow-up period of Extension B, would include a Follow-up visit at 4 weeks ± 7 days after the Discontinuation Visit, and would occur for subjects who discontinue or who choose not to switch to the commercial product. Clarified, in the text, that subjects in all countries can enroll in Extension A. Clarified that the study visit window during Extension B is ± 6 days of the scheduled visit. Clarified that the initial assessment of Extension B was performed at the final visit of Extension A Maintenance period (ie, Visit 12). Grammatical, typographical, and formatting changes were also made.
13 July 2018	Amendment 04: Clarified, in the text, that the Pretreatment Phase consists of a Screening/Baseline period. Clarified, in the text, the approximate total study duration. Clarified, in the text, that subjects in Japan and in countries where an extended access program (EAP) cannot be implemented can enroll in Extension B. Specified criteria for participation in Extension B for subjects in countries where an EAP cannot be implemented. Clarified the CGI objective (CGIS is the baseline assessment and CGIC is the postbaseline assessment of the CGI). Grammatical, typographical, and formatting changes were also made.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
