

Clinical trial results:

A Randomized, Open-label, Controlled Phase 3 Trial to Investigate the Efficacy, Safety, and Tolerability of the BiTE® Antibody Blinatumomab as Consolidation Therapy Versus Conventional Consolidation Chemotherapy in Pediatric Subjects With High-risk First Relapse B-precursor Acute Lymphoblastic Leukemia (ALL)

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	Yes
EMA paediatric investigation plan number(s)	EMA-000574-PIP02-12
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	Yes

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	05 December 2022
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	05 December 2022
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

To evaluate event-free survival (EFS) after blinatumomab when compared to standard of care (SOC) chemotherapy.

Protection of trial subjects:

The study was conducted in accordance with the International Council for Harmonisation Good Clinical Practice and applicable national or regional regulations/guidelines.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	10 November 2015
Long term follow-up planned	Yes
Long term follow-up rationale	Safety, Efficacy
Long term follow-up duration	36 Months
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Australia: 4
Country: Number of subjects enrolled	Belgium: 2
Country: Number of subjects enrolled	Czechia: 2
Country: Number of subjects enrolled	Denmark: 2
Country: Number of subjects enrolled	Israel: 3
Country: Number of subjects enrolled	Netherlands: 2
Country: Number of subjects enrolled	Poland: 2
Country: Number of subjects enrolled	France: 11
Country: Number of subjects enrolled	Germany: 22
Country: Number of subjects enrolled	Italy: 42
Country: Number of subjects enrolled	Portugal: 4
Country: Number of subjects enrolled	Spain: 8
Country: Number of subjects enrolled	United Kingdom: 7
Worldwide total number of subjects	111
EEA total number of subjects	97

Notes:

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	3
Children (2-11 years)	88
Adolescents (12-17 years)	20
Adults (18-64 years)	0
From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

This study was conducted at 48 centers across 13 countries (Europe, Australia, Israel). The first participant was enrolled on 10 November 2015. The last participant enrolled on 30 August 2019. The primary completion date was 17 July 2019 and the study completion date was 05 December 2022.

Pre-assignment

Screening details:

After a 3-week screening period, participants were enrolled and randomized 1:1 into 1 of 2 treatment groups: High Risk Consolidation 3 (HC3) chemotherapy or blinatumomab. Randomization was stratified by age and bone marrow/minimal residual disease (MRD) status.

Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
Arm title	HC3 Chemotherapy

Arm description:

One week of treatment with HC3 followed by 3 weeks of no treatment. The standard intensive consolidation chemotherapy course HC3 includes dexamethasone (10 mg/m²/day intravenous [IV] on Days 1-6), vincristine (1.5 mg/m²/day IV on Days 1 and 6), daunorubicin (30 mg/m² IV over 24 hours on Day 5), methotrexate (1 g/m² IV over 36 hours on Day 1), ifosfamide (800 mg/m² IV for 1 hour on Days 2-4), and pegylated [PEG]-asparaginase (1000 U/m² IV for 2 hours or intramuscularly [IM] on Day 6) or, if allergic, erwinia-asparaginase (20,000 units/m² IV or IM every 48 hours for a total of 6 doses).

Arm type	Active comparator
Investigational medicinal product name	SOC chemotherapy
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Infusion
Routes of administration	Intravenous use, Intramuscular use

Dosage and administration details:

The standard intensive consolidation chemotherapy course HC3 included dexamethasone (10 mg/m²/day IV on Days 1-6), vincristine (1.5 mg/m²/day IV on Days 1 and 6), daunorubicin (30 mg/m² IV over 24 hours on Day 5), methotrexate (1 g/m² IV over 36 hours on Day 1), ifosfamide (800 mg/m² IV for 1 hour on Days 2-4), and PEG-asparaginase (1000 U/m² IV for 2 hours or IM on Day 6) or, if allergic, erwinia-asparaginase (20,000 units/m² IV or IM every 48 hours for a total of 6 doses).

Arm title	Blinatumomab
------------------	--------------

Arm description:

One 4-week cycle of blinatumomab
15 µg/m²/day as a continuous intravenous infusion (CIVI).

Arm type	Experimental
Investigational medicinal product name	Blinatumomab
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for infusion, Powder for infusion
Routes of administration	Intravenous use

Dosage and administration details:

Blinatumomab was administered as CIVI at a constant daily flow rate of 15 µg/m²/day over 4 weeks

(1 cycle).

Number of subjects in period 1	HC3 Chemotherapy	Blinatumomab
Started	57	54
Participants Treated	52	54
Primary analysis population	54	54
Final analysis population	57	54
Completed	16	33
Not completed	41	21
Adverse event, serious fatal	27	10
Consent withdrawn by subject	11	6
Decision by Sponsor	2	4
Lost to follow-up	1	1

Subject analysis set description:

Participants in the full analysis set at the primary completion date randomized to blinatumomab

Primary: Kaplan Meier Estimate: EFS (Primary Analysis)

End point title	Kaplan Meier Estimate: EFS (Primary Analysis)
-----------------	---

End point description:

EFS is calculated from the time of randomization until the date of relapse or M2 marrow after having achieved a complete remission (CR), failure to achieve a CR at the end of treatment, second malignancy, or death due to any cause, whichever occurs first. Participants who failed to achieve a CR following treatment with investigational product (IP) or who died before the disease assessment at the end of treatment were considered treatment failures and assigned an EFS duration of 1 day. Participants still alive and event-free were censored on their last disease assessment date. Participants were said to be in CR when they had the following: M1 marrow, peripheral blood without blasts, absence of extramedullary leukemic involvement. Full analysis set (FAS): randomized participants analyzed according to their randomized treatment assignment, regardless of the treatment received (primary analysis population).

99999 = data was not estimable.

End point type	Primary
----------------	---------

End point timeframe:

As of the primary analysis data cutoff date (17 July 2019), overall median follow-up time for EFS was 22.4 months.

Secondary: Percentage of Participants With an MRD Response Within 29 Days of Treatment Initiation

End point title	Percentage of Participants With an MRD Response Within 29 Days of Treatment Initiation
-----------------	--

End point description:

At the end of the first treatment cycle (Day 29) a bone marrow aspiration/biopsy was performed and evaluated by the central MRD laboratory. MRD response was defined as MRD level < 10⁻⁴, by polymerase chain reaction (PCR) or flow cytometry, at the end of treatment (Cycle 1 Day 29) with study drug. Participants who were part of the MRD Evaluable Set and were missing the end of treatment (Cycle 1 Day 29) assessment for a respective MRD assessment method were considered not to have achieved a response. MRD Evaluable Set: participants for whom an evaluable baseline MRD marker can be found with either of the MRD assessment methods of PCR or flow cytometry.

End point type	Secondary

Secondary: Number of Participants With Treatment-Emergent Adverse Events (TEAEs) and Treatment-Related Adverse Events (TRAEs)

End point title	Number of Participants With Treatment-Emergent Adverse Events (TEAEs) and Treatment-Related Adverse Events (TRAEs)
-----------------	--

End point description:

Adverse event (AE): any untoward medical occurrence. Serious AE: an AE meeting at least 1 of the following serious criteria: fatal; life-threatening; requires in-patient hospitalization or prolongation of existing hospitalization; results in persistent or significant disability/incapacity; congenital anomaly/birth defect; other medically important serious event. Severity was graded according to the Common Terminology Criteria for AEs (CTCAE) version 4.03: 1=mild, 2=moderate, 3=severe, 4=life-threatening, 5=death. Investigational product (IP) in the HC3 arm refers to dexamethasone, methotrexate, daunorubicin, erwinase, ifosfamide, asparaginase, and vincristine, and in the blinatumomab arm refers to blinatumomab. Treatment-related refers to the assessment of a relationship between IP and the event.

Safety Analysis Set: participants who received protocol-specified therapy analyzed according to the treatment they received.

End point type	Secondary
----------------	-----------

End point timeframe:

From first dose of IP through the last dose of IP (up to Day 29) plus 30 days.

Secondary: Kaplan-Meier Estimate of 100-Day Mortality After Allogeneic Hematopoietic Stem Cell Transplantation (alloHSCT)

End point title	Kaplan-Meier Estimate of 100-Day Mortality After Allogeneic Hematopoietic Stem Cell Transplantation (alloHSCT)
-----------------	--

End point description:

The analysis of 100-day mortality after alloHSCT was assessed for participants who received an alloHSCT while in remission and did not receive any additional anti-leukemic treatment. 100-day mortality after alloHSCT was calculated relative to the date of alloHSCT. The 100-day mortality rate after alloHSCT was defined as the percentage of participants having died up to 100 days after alloHSCT, estimated using the estimated time to death in percent calculated by Kaplan-Meier methods. Participants still alive were censored at the date they were last known to be alive.

HSCT Analysis Set: participants who underwent an HSCT while in remission without any other anti-leukemic therapy.

End point type	Secondary
----------------	-----------

End point timeframe:

From the date of alloHSCT until death/censor date; median follow up time was 1742.0 days for blinatumomab and 1619.0 days for HC3.

End point values	HC3 Chemotherapy	Blinatumomab

Adverse events

Adverse events information

Timeframe for reporting adverse events:

All-cause mortality is reported from randomization through the end of study; the median overall follow-up time was 55.2 months. Treatment-emergent adverse events are reported from first dose of IP through the last dose of IP (up to Day 29) plus 30 days.

Adverse event reporting additional description:

All-cause mortality is reported for all participants enrolled/randomized in the study. Serious adverse events and other adverse events are reported for all participants who received at least one dose of study drug.

Assessment type	Systematic

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
15 April 2015	<ul style="list-style-type: none">- modified exclusion criteria to clarify that participants with abnormal serum creatinine were to be excluded from the study- added measures to prevent and/or minimize pain and discomfort during blood draws- added measures to minimize the blood volumes drawn during the study
29 September 2015	<ul style="list-style-type: none">- added prophylactic intrathecal hydrocortisone as an alternative to prednisolone to allow the United Kingdom and Australia to participate in the study- changed distribution of sites participating in the study (New Zealand was removed)- changed the time period for administration of intrathecal prophylaxis to align with best medical practice for the standard of care arm- added "cumulative incidence of relapse" to secondary endpoints- clarified that MRD aliquots for PCR and/or flow cytometry that were to be collected at screening, Day 15 (blinatumomab arm only), and at Day 29 were to be analyzed at a central lab defined by the sponsor- updated pregnancy, contraception, and lactation requirements to align with current risk and discomforts language
19 April 2016	<ul style="list-style-type: none">- added "population PK analysis" as a secondary endpoint- corrected the time frame for administration of intrathecal prophylaxis as premedication in the HC3 arm- changed treatment-free interval from 2 weeks to 1 week when defining a cycle in the adaptive design- updated the number of sites from 60 to 75- in inclusion criteria, added a requirement for historical samples for central analysis of MRD- updated exclusion criteria to clarify that for participants with total bilirubin < 1.5 mg/dL, measurement of direct bilirubin was not required, and to remove exclusion of other investigational procedures during study contact- clarified that maximum daily dose of blinatumomab was not to exceed 28 µg/day- clarified criteria for discontinuation of blinatumomab- updated laboratory analyte listing- updated language for pregnancy and lactation reporting

11 July 2017	<ul style="list-style-type: none"> - added text to "evaluate PK of blinatumomab" to the secondary objectives. Previously, this was an endpoint that was not listed as an objective - secondary endpoints for population PK analysis were clarified - clarified that not all participants were to proceed to transplant if M1 marrow occurred after consolidation (reasons not to proceed to transplant may include issues such as donor not available, infection, organ function issues) - updated number of study centers from 75 to 82 - updated the definition of primary completion to include the premature conclusion of the study - updated inclusion criteria to remove definition of M2 marrow and to exclude central nervous system relapse participants from having to supply material requested for central lab MRD analysis - updated exclusion criteria to change direct bilirubin values to total bilirubin and increased the acceptable level of total bilirubin for study entry, to indicate that other exclusion criteria do not have to resolve to \leq grade 2 for study participation and to clarify that asparaginase reactions were not an exclusion criterion - clarified that the screening period could be extended by up to 7 days for bone marrow count recovery and/or scheduling of bone marrow collection only - clarified that anticonvulsant treatment needed to be started before resumption of the cycle after a seizure had interrupted the blinatumomab infusion - clarified that blinatumomab should only be discontinued in case of blinatumomab-related relevant neurologic events - added allergic reactions as a complication that occurs with asparaginase - clarified the concomitant medications that needed to be collected - clarified the timing of intrathecal chemotherapy and that it could have been administered before signing consent as long as it was administered within 7 days prior to treatment start
05 December 2017	<ul style="list-style-type: none"> - adaptation was removed from the protocol to align with the Pediatric Investigation Plan amendment - inclusion criterion updated to clarify what cases were exempt from supplying material from relapse for PCR central lab analysis - the section on excluded treatments and/or procedures during the study period was updated to exclude participants who received additional cycles of the study drugs (HC3 or blinatumomab) after the treatment cycle was completed until an event occurred - long-term follow-up for participants was changed from 36 months after alloHSCT to until the last participant enrolled on the study was 36 months after alloHSCT to allow longer follow-up data on the participants to be collected while the study was open - primary completion and end of study language was updated
01 November 2019	<ul style="list-style-type: none"> - added an exploratory endpoint - updated the number of study centers from 82 to 113 - updated adverse event guidance
23 December 2021	<ul style="list-style-type: none"> - clarified that adverse events associated with key safety parameter should be reported for the duration of the study with the exception of those related to other anti-cancer therapies occurring post blinatumomab treatment could be excluded - updated language to clarify that serious adverse events suspected to be related to blinatumomab that the investigator became aware of were to be reported to Amgen within 24 hours of awareness during the long-term follow-up phase - changed the contraception period, avoidance of pregnancy, breast feeding, and sperm donation period from 6 months to 48 hours - updated the language for reporting procedures for adverse events and serious adverse events - clarified that only adverse events and serious adverse events were to be reported if there was harm from overdose - updated the serious adverse event reporting, pregnancy, and lactation form in the appendices
01 August 2022	<ul style="list-style-type: none"> - updated contraception duration - clarified that where there was a potential overlap of contraceptive duration requirements due to different treatments, the most conservative contraceptive duration requirement was to be followed - overdose language was updated to inform that for HC3 chemotherapy or concomitant medications, overdose was not to be reported as an adverse event/serious adverse event unless it was an intentional overdose

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
