

Clinical trial results:

A prospective, randomised, non-inferiority study of Chloroprocaine 2% and the active control Ropivacaine 0.75% (AstraZeneca) in ultrasound-guided axillary nerve block for short-duration distal upper limb surgery
Summary

EudraCT number	2014-002519-40

Notes:

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	24 May 2017
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	24 May 2017
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

This study evaluate the Non-inferiority evaluation of Test versus Reference product in terms of proportion of subjects with a successful block for distal upper limb surgeries, without any supplementation in the first 45 min (see definitions below), calculated from the time of readiness for surgery (complete sensory block).

Successful block: anaesthesia adequate for the surgery (complete sensory block), without any supplementation in the first 45 min (even if surgery lasts for > 45 min), calculated from the time of readiness for surgery (complete sensory block).

Supplementation: i.v. premedication or general anaesthesia or pre- or intra-operative systemic analgesia or additional local anaesthetic infiltration

Protection of trial subjects:

In order to avoid any risk for patients, the following exclusion criteria have been considered:

1. Physical findings: Clinically significant abnormal physical findings which could interfere with the objectives of the study. Contraindications to peripheral nerve block anaesthesia. History of neuromuscular diseases to the upper extremities
2. Axillary status: Axillary local infections, surgical scarring and pathological lymph node enlargement
3. ASA physical status: IV-V
4. Further anaesthesia: Patients anticipated to be requiring further anaesthesia (general or local anaesthesia)
5. Chronic pain syndromes: Patients with chronic pain syndromes (taking opioids, antidepressants, anticonvulsant agents)
6. Allergy: Ascertained or presumptive hypersensitivity to the active principle and/or formulations ingredients; ascertained or presumptive hypersensitivity to the amide and ester-type anaesthetics
7. Diseases: Significant history of renal, hepatic, gastrointestinal, cardiovascular, respiratory, skin, haematological, endocrine or neurological diseases that could interfere with the aim of the study; ascertained psychiatric diseases, sepsis, blood coagulation disorders, insulin dependent diabetes mellitus, terminal kidney failure
8. Medications: Medication known to interfere with the extent of regional blocks (see chloroprocaine and ropivacaine SmPCs) for 2 weeks before the start of the study. Hormonal contraceptives for females were allowed
9. Investigative drug studies: Participation in the evaluation of any investigational product for 3 months before this study, calculated from the first day of the month following the last visit of the previous study
10. Drug, alcohol: History of drug or alcohol abuse
11. Pregnancy: Missing or positive pregnancy test at screening, pregnant or lactating women

Background therapy:

N/A

Evidence for comparator:

Ropivacaine HCl 0.75% was chosen as the active control because it represents the gold standard anaesthetic for brachial plexus block procedures and it is commonly used in Germany, Switzerland and other European countries in brachial plexus block procedures.

Ropivacaine HCl 0.75% is the only authorised concentration of ropivacaine for this indication

Actual start date of recruitment	30 January 2015
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Switzerland: 87
Country: Number of subjects enrolled	Austria: 124
Worldwide total number of subjects	211
EEA total number of subjects	124

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	147
From 65 to 84 years	60
85 years and over	4

Subject disposition

Recruitment

Recruitment details:

The recruitment lasted from April 2015 to May 2017 and occurred in Medical clinics and Hospitals

Pre-assignment

Screening details:

Inclusion criteria:

1. Male and female patients scheduled for short duration (< 60 min) distal upper limb surgery under axillary nerve block anaesthesia
2. Age \geq 18 yo
3. BMI: 18-32 kg/m² inclusive
4. ASA physical status: I-III
5. Signed ICF before inclusion in the study
6. Comprehension of the purpose of the study, including risks and side effects

Period 1

Period 1 title	overall trial (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator

Blinding implementation details:

All the clinical staff members involved in anaesthesia, surgery and study-related activities (Investigator/co-investigators/study nurses) as well as the patients were blind with respect to the administered treatment.

Syringes for injection were prepared out of the operating area by a person not involved in any other study-related activity. Only the person preparing the syringe and the CRA in charge of investigational products' accountability were aware of the administered treatments.

Arms

Are arms mutually exclusive?	Yes
Arm title	Chloroprocaine

Arm description:

Chloroprocaine 2% Solution for injection, single administration by axillary nerve route 20 mL

Arm type	Experimental
Investigational medicinal product name	Chloroprocaine HCl 2%
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection
Routes of administration	Perineural use

Dosage and administration details:

Chloroprocaine HCl 2% injection (20 mg/mL)

Arm title	Ropivacaine
------------------	-------------

Arm description:

Naropin®, Ropivacaine 0.75% Solution for injection, single administration by axillary nerve route 20 mL

Arm type	Active comparator
Investigational medicinal product name	Ropivacaine HCl 0.75%
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection
Routes of administration	Perineural use

Dosage and administration details:

Naropin®, Ropivacaine HCl 0.75% injectable solution (7.5 mg/mL)

Number of subjects in period 1	Chloroprocaine	Ropivacaine
Started	106	105
Completed	105	103
Not completed	1	2
Consent withdrawn by subject	1	1
Lost to follow-up	-	1

Statistical analyses

Statistical analysis title	proportion of subjects with a successful block FAS
-----------------------------------	--

Statistical analysis description:

The proportion of subjects (FAS set) who achieved a successful block, defined as anaesthesia adequate for the surgery, without any supplementation in the first 45 min from the time of readiness for surgery (see § 9.5.1.2), was 89/98 (90.8%) with Chloroprocaine HCl 2% and 92/99 (92.9%) with Ropivacaine HCl 0.75% (Table 14.2.1.1).

Comparison groups	Chloroprocaine v Ropivacaine
Number of subjects included in analysis	209
Analysis specification	Pre-specified
Analysis type	non-inferiority ^[1]
P-value	= 0.0125
Method	binomial regression

Notes:

[1] - Results of the statistical analysis on the FAS (sensitivity analysis) confirmed the results obtained with the PP set (primary analysis), with 96/105 (91.4%) patients with a successful block for Chloroprocaine HCl 2% and 97/104 (93.3%) patients with a successful block for Ropivacaine HCl 0.75% (Table 14.2.1.2), and a derived 95% confidence interval of -0.091, 0039 (p-value=0.0125) (Table 14.2.1.5).

Primary: Percentage of patients with successful block for distal upper limb surgeries _PP

End point title	Percentage of patients with successful block for distal upper limb surgeries _PP
-----------------	--

Statistical analyses

Statistical analysis title	frequency of patients with a successful block PP
-----------------------------------	--

Statistical analysis description:

The proportion of subjects (PP set) who achieved a successful block, defined as anaesthesia adequate for the surgery, without any supplementation in the first 45 min from the time of readiness for surgery (see § 9.5.1.2), was 89/98 (90.8%) with Chloroprocaine HCl 2% and 92/99 (92.9%) with Ropivacaine HCl 0.75% (Table 14.2.1.1).

Comparison groups	Ropivacaine v Chloroprocaine
Number of subjects included in analysis	197
Analysis specification	Pre-specified
Analysis type	non-inferiority ^[2]
P-value	= 0.021
Method	binomial regression

Notes:

[2] - The overall proportion of subjects with a successful block (all centres) was compared between treatment groups using a binomial regression model, with the factors treatment and analysis centre as fixed effects. Results showed that non-inferiority of Chloroprocaine HCl 2% with respect to Ropivacaine HCl 0.75%, administered by axillary injection under ultrasound guidance, was confirmed (Table 14.2.1.3).

Adverse events

Adverse events information

Timeframe for reporting adverse events:

from Visit 1 - Screening to Telephonic Follow-up (from Days -14/1 to Day 7±1)

Adverse event reporting additional description:

AEs monitored from the screening visit, immediately after informed consent signature, up to the telephonic follow-up. Particular attention was given to systemic and local toxicity symptoms, neurological symptoms (e.g. paraesthesia, motor function problems and pain at the injection site) and allergic reactions.

NO SAE occurred.

Assessment type	Systematic

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
06 November 2014	<p>Amendment 1.0, final protocol version 2.0 dated 17SEP2014.</p> <p>The following points have been added:</p> <p>Inclusion in the study of inpatients beside outpatients</p> <p>Urine pregnancy test for women at screening visit</p> <p>An impartial witness can sign the informed consent form when the subject is physically unable to sign due to the distal upper limb injury</p> <p>Normal ranges for haemodynamic variables and ECG</p> <p>Recommended maximal deviations from the scheduled block assessment times.</p> <p>The secondary study variable "time to home discharge" has been changed into "time to eligibility for home discharge"</p> <p>A typing mistake at § 8.2 has been corrected</p> <p>An address at § 16.4 has been changed</p> <p>A reference at § 17 has been changed</p>
18 December 2014	<p>Amendment 2.0, final protocol version 3.0 dated 3DEC2014.</p> <p>The following changes have been introduced:</p> <p>The study will be performed as double blind and not as observer-blind</p> <p>Assessment of neurological symptoms as safety secondary endpoint</p> <p>Clinical justification of the chosen non-inferiority limit</p> <p>Clinical justification of the expected success rate in both treatment arms</p> <p>Conditions that will be used for establishing the convergence failure of the binomial regression model and, consequently, for applying the Poisson regression model with a robust error variance</p> <p>A mistake in the exclusion criteria n. 6 has been corrected.</p> <p>Discharge criteria based on the modified Aldrete's scale have been corrected.</p> <p>The e-mail address for SAE reporting has been changed.</p> <p>The name of one of the companies in charge of the study monitoring has changed</p> <p>In § 13.1 a sentence has been added.</p> <p>Some additional minor changes have been introduced.</p>
30 July 2015	<p>Amendment Nr. 4, protocol final version 4.0 dated 22MAY2015</p> <p>The present amendment introduces the following changes in the study protocol:</p> <ul style="list-style-type: none">-A new Clinical Site has been involved in the study to replace the German site of Marburg, following the negative opinion of the Ethics Committee of the Faculty of Medicine of Marburg, which rejected the study on the basis of statistical considerations about the non-inferiority margin. On the contrary, the German Regulatory Authority BfArM approved the study without any concern. In Switzerland the study was approved by the Cantonal Ethics Committee of Ticino and by the Regulatory Authority Swissmedic.-Prof. Hinnerk Wulf, MD. Professor and Chairman of the Department of Anesthesiology and Intensive Care Medicine of the University Hospital of Marburg is now Medical Adviser-One of the companies in charge of the study monitoring has changed-The sample size of the study has been recalculated using a higher power (85% instead of 80%)-It has been further clarified that the reference time for calculating the scheduled time interval of the post-surgery assessments is the time of surgery end

10 November 2015	<p>Amendment 5, final protocol version 5.0 dated 9OCT2015</p> <p>The present amendment introduces the following changes in the study protocol:</p> <ul style="list-style-type: none"> - A second Clinical Site in Austria (clinical centre N. 4) has been involved in the study - The Swiss Site of Bellinzona (clinical centre N. 3) has terminated its participation in the study due to enrolment difficulties - Prof. Oliver Kimberger, Medical Director of Orthopedic and Trauma Anesthesia, Department of General Anesthesia and Intensive Care Medicine of the Medical University of Vienna (clinical centre N. 1), is now the coordinating investigator in Austria - The definitions of sensory and motor block regression have been clarified - The definition of analysis centres has been introduced <p>The rationale for the change is the need to replace the Swiss site of Bellinzona following its withdrawal from the study due to difficulties with patients' recruitment and to introduce the definition of analysis centres for the study statistical analysis.</p> <p>This amendment is considered substantial because it introduces a new Clinical Site and the definition of the analysis centres, which will be used as fixed effect in the regression model of the primary efficacy analysis instead of the clinical centres.</p>
28 December 2016	<p>Amendment 7 dated 13DEC2016.</p> <p>The present amendment introduces the following changes to the study protocol:</p> <ul style="list-style-type: none"> -Clinical site N. 4 (Klagenfurt, Austria. Principal Investigator: Prof. R. Likar) will enrol 36 and not 60 patients as previously planned. The 24 patients not enrolled at this site will be redistributed. These patients will be enrolled at site N. 1 (16 patients) and N.2 (8 patients), as also detailed below. -Clinical site N. 1 (Vienna, Austria. Principal Investigator: Prof. O. Kimberger) will enrol 16 additional patients for a total of 88 patients (72 patients as originally planned + 16 additional patients) -Clinical site N. 2 (Gravesano, Switzerland. Principal Investigator: Dr. C. Camponovo) will enrol 8 additional patients for a total of 80 patients (72 patients as originally planned + 8 additional patients) -The reason for exclusion from the Per Protocol set "more than 20% of the actual block assessment times outside the recommended ranges" has to be changed into "deviations from the actual block assessment times until readiness for surgery outside the recommended ranges that can bias the evaluation of the time of readiness for surgery"

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No
