

Clinical trial results:

A Phase 1/2 Study of Venetoclax in Combination with Low-Dose Cytarabine in Treatment-Naïve Subjects with Acute Myelogenous Leukemia Who Are 60 Years of Age and Who Are Not Eligible for Standard Anthracycline-Based Induction Therapy

Summary

EudraCT number	2014-002610-23
Trial protocol	DE IT
Global end of trial date	10 August 2021

Results information

Result version number	v1 (current)
This version publication date	19 August 2022
First version publication date	19 August 2022

Notes:

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	10 August 2021
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	10 August 2021
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The primary objectives of the Phase 1 portion are to assess the safety profile, characterize PK, determine the dose schedule, the maximum tolerated dose (MTD), and the recommended Phase 2 dose (RPTD) of venetoclax in combination with low-dose cytarabine (LDAC) in treatment-naïve subjects with AML who are ≥ 65 years of age and who are not eligible for standard induction therapy due to co-morbidity or other factors.

The primary objectives of the initial Phase 2 portion of the study are to evaluate the preliminary estimates of efficacy including the overall response rate (ORR), and to characterize the toxicities of the combination at the RPTD.

Protection of trial subjects:

Subject read and understood the information provided about the study and gave written permission.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	31 December 2014
Long term follow-up planned	Yes
Long term follow-up rationale	Efficacy
Long term follow-up duration	1 Years
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Australia: 26
Country: Number of subjects enrolled	Germany: 8
Country: Number of subjects enrolled	Italy: 3
Country: Number of subjects enrolled	United States: 57
Worldwide total number of subjects	94
EEA total number of subjects	11

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0

Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	2
From 65 to 84 years	86
85 years and over	6

Subject disposition

Recruitment

Recruitment details:

Previously untreated adults with acute myeloid leukemia (AML) who were ineligible for intensive chemotherapy were enrolled between December 2014 and May 2017.

The study consisted of a dose escalation phase (Phase 1) and a dose expansion phase (Phase 2).

Pre-assignment

Screening details:

Nine study sites in the United States, Australia, Germany, and Italy screened 116 subjects (most screen failures were due to inclusion/exclusion criteria), and 94 subjects at 9 sites were enrolled.

Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Not applicable
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
Arm title	Phase 1: 600 mg Venetoclax + LDAC

Arm description:

Venetoclax was administered orally once daily (QD) on Days 2 through 28 of Cycle 1. Dosing started at 50 mg (Day 2) and increased up to 600 mg by Day 6. Beginning with Cycle 2, 600 mg venetoclax was administered Days 1 through 28 of each 28-day cycle. Participants also received low-dose cytarabine (LDAC; 20 mg/m²) administered by subcutaneous injection once daily on Days 1 to 10 of each cycle. Participants could continue receiving treatment until disease progression or until discontinuation criteria were met.

Arm type	Experimental
Investigational medicinal product name	Venetoclax
Investigational medicinal product code	ABT-199 (GDC-0199)
Other name	VENCLEXTA®
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

Tablets taken orally once a day

Investigational medicinal product name	Cytarabine
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection
Routes of administration	Subcutaneous use

Dosage and administration details:

Administered by subcutaneous injection on Days 1 to 10 of each 28-day cycle

Arm title	Phase 1: 800 mg Venetoclax + LDAC
------------------	-----------------------------------

Arm description:

Venetoclax was administered orally once daily (QD) on Days 2 through 28 of Cycle 1. Dosing started at 100 mg (Day 2) and increased up to 800 mg by Day 6. Beginning with Cycle 2, 800 mg venetoclax was administered Days 1 through 28 of each 28-day cycle. Participants also received LDAC (20 mg/m²) administered by subcutaneous injection once daily on Days 1 to 10 of each cycle. Participants could continue receiving treatment until disease progression or until discontinuation criteria were met.

Primary: Phase 1: Number of Participants With Dose-limiting Toxicities

End point title	Phase 1: Number of Participants With Dose-limiting
End point description: Dose-limiting toxicities (DLTs) were determined during cycle 1 of the dose-escalation phase and defined as Common Terminology Criteria for Adverse Events (CTCAE) Version 4.0 grade 4 (life threatening requiring urgent intervention) or 5 (resulted in death) toxicity, excluding adverse events commonly caused by AML (eg, neutropenia, fever). Hematologic DLT was defined as failure of platelet recovery to $25 \times 10^9/L$ or greater and absolute neutrophil count (ANC) to $0.5 \times 10^9/L$ or greater within 14 days of the last dose of venetoclax in the absence of residual AML. The DLT-evaluable population included participants who received at least 80% of planned Cycle 1 doses during the dose-escalation phase (Phase 1)	
End point type	Primary
End point timeframe: Up to 28 days (Cycle 1)	

Notes:

[1] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: No formal statistical testing was conducted.

[2] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period.

Justification: DLTs were only analyzed in Phase 1.

Statistical analyses

No statistical analyses for this end point

Primary: Overall Response Rate

End point title	Overall Response Rate ^[17]
-----------------	---------------------------------------

End point description:

Overall response rate (ORR) is defined as the percentage of participants who achieved a complete remission (CR), complete remission with incomplete marrow recovery (CRi), or partial remission (PR) per the International Working Group (IWG) for AML response criteria, per investigator assessment. CR: absolute neutrophil count (ANC) $\geq 10^3$ / μ L, platelet counts $\geq 10^5$ / μ L, red blood cell (RBC) transfusion independence (a period of at least 56 days with no RBC transfusion), and bone marrow with < 5% blasts.

CRi: lack of morphologic evidence of leukemia (blasts < 5%), and platelet counts < 10^5 / μ L or ANC < 10^3 / μ L.

PR: all of the hematologic values for a CR but with a decrease of at least 50% in the percentage of blasts to 5% to 25% in the bone marrow aspirate.

End point type	Primary
----------------	---------

End point timeframe:

Response was assessed at Cycle 2, Day 1, Cycle 4, Day 1, and every 3 cycles thereafter; median duration of treatment was 4.2 months.

Notes:

[17] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: No formal statistical testing was conducted.

End point values	Phase 1+2: 600 mg Venetoclax + LDAC			
Subject group type	Subject analysis set			
Number of subjects analysed	82			
Units: percentage of participants				
number (confidence interval 95%)	54.9 (43.5 to 65.9)			

Statistical analyses

No statistical analyses for this end point

Primary: Number of Participants With Treatment-emergent Adverse Events (TEAEs)

End point title	Number of Participants With Treatment-emergent Adverse Events (TEAEs) ^[18]
-----------------	---

End point description:

An adverse event (AE) is defined as any untoward medical occurrence in a patient or clinical investigation subject administered a pharmaceutical product and which does not necessarily have a causal relationship with this treatment. Treatment-emergent events are defined as events that began or worsened in severity after the first dose of study drug. The investigator rated the severity of each AE

according to the CTCAE Version 4.0 and the following:

Grade 1: The AE is transient and easily tolerated (mild).

Grade 2: The AE causes discomfort and interrupts usual activities (moderate).

Grade 3: The AE causes considerable interference with usual activities and may be incapacitating (moderate to severe).

Grade 4: The AE is life threatening requiring urgent intervention.

Grade 5: The AE resulted in death.

The investigator assessed each event as either having a reasonable possibility or no reasonable possibility of being related to the use of study drug.

End point type	Primary
----------------	---------

End point timeframe:

From first dose of study drug until 30 days after last dose of study drug; median (minimum, maximum) duration of treatment was 4.1 (0.2, 62.8) months overall.

Notes:

[18] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: No formal statistical testing was conducted.

Secondary: Complete Remission Rate

End point title	Complete Remission Rate
-----------------	-------------------------

End point description:

Complete remission (CR) rate is defined as the percentage of participants who achieved a complete remission at any time point during the study per the modified IWG criteria for AML and investigator assessment.

CR: absolute neutrophil count (ANC) $\geq 10^3/\mu\text{L}$, platelet counts $\geq 10^5/\mu\text{L}$, red blood cell (RBC) transfusion independence (a period of at least 56 days with no RBC transfusion), and bone marrow with $< 5\%$ blasts.

Participants who never achieved CR or had no IWG disease assessment were considered to be non-responders in the calculation of CR rate.

End point type	Secondary
End point timeframe:	
Response was assessed at Cycle 2, Day 1, Cycle 4, Day 1, and every 3 cycles thereafter; median duration of treatment was 4.2 months.	

End point values	Phase 1+2: 600 mg Venetoclax + LDAC			
Subject group type	Subject analysis set			
Number of subjects analysed	82			
Units: percentage of participants				
number (confidence interval 95%)	25.6 (16.6 to 36.4)

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
11 November 2015	<p>The purpose of this amendment is to:</p> <ul style="list-style-type: none">• Update ABT-199 throughout protocol with venetoclax (ABT-199/GDC-0199).• Update Introduction with the most current venetoclax information released in the Investigator's Brochure (IB) Edition 6.• Update 95% Confidence Intervals for Assumed Observed Rates Based on Sample Size of 50 Subjects; and increase the number of subjects to be enrolled in Phase 2 to approximately 50 to improve accuracy of estimation of the Overall Response Rate (ORR).• Update Inclusion Criteria to remove the requirement to do 24-hour urine collection for subjects whose BMI is > 25 and alert investigators to consider measuring creatinine clearance in other situations if appropriate.• Update Exclusion Criteria, Prior and Concomitant Therapy; Excluded and Cautionary Medications and Dietary Restrictions to be consistent with updated PK findings.• Replace Week 12 with Cycle 3 throughout the protocol.• Change every 12 weeks to every 3 Cycles.• Add Bone Marrow Aspirate for Bcl-2 Family Protein Analysis sample to allow investigation of the relationship between pre-treatment potential biomarkers and response to venetoclax treatment and to evaluate for the potential change of potential biomarkers after treatment.• Add a Cycle 4 Day 1 pharmacogenetic sample.• Update Tumor Lysis Syndrome Prophylaxis to start 24 hours prior to first dose and Confinement requirements since for some subjects hydration and allopurinol administration can be achieved equally well without hospital admission.• Clarified sample analysis process information.• Clarified results to be reported• Update Deaths to note that deaths due solely to the progression of AML should not be considered an adverse event.• Addition of AbbVie Medical Escalation Hotline information.• Clarify definition of dose-limiting toxicity.

28 November 2016	<ul style="list-style-type: none"> • Updated introduction with new venetoclax preclinical toxicology. • Updated the primary objective and added Cohort C to the study, increasing the sample size by 20 subjects, to evaluate ORR and safety when allowing subjects who potentially require co-treatment with a strong CYP3A inhibitor. • Added the Cohort C study population to add additional objective criteria to help define subjects with AML who are not eligible for anthracycline-based induction therapy. • Added the Cohort C dosing instruction to simplify dosing for subjects to receive both LDC and venetoclax starting on Day 1. • Updated Overall Study Design and Plan, Safety and Efficacy Measurement, Discontinuation of Individual Subjects with Post-treatment follow-up visit and Survival Assessment language to evaluate the disease course and survival of subjects after study treatment has concluded. • Inclusion Criteria updated to clarify subject's age, include subjects with ECOG performance status of 3 for subjects who are 60 – 74 years of age, include subjects with Creatinine Clearance of greater or equal to 30 mL/min, clarify bilirubin requirements for subjects with different age group, and clarify the postmenopausal female population requirement for the study entry. • Exclusion Criteria updated to allow strong and moderate CYP3A inhibitors under cautionary medication with appropriate dose reduction, allow subjects with cardiovascular disability status of New York Heart Association up to Class 2, exclude subjects with history of myeloproliferative neoplasm (MPN) including polycythemia vera, myelofibrosis, essential thrombocythemia, or chronic myelogenous leukemia. • Updated dose modification required if moderate or strong CYP3A inhibitor is taken. • Added Complaints section. • Updated Dose Reduction Guidelines for Management of Persistent Neutropenia or Thrombocytopenia. • Updated Prophylaxis and Management of Tumor Lysis Syndrome (TLS).
31 May 2017	<ul style="list-style-type: none"> • Updated introduction section with the new venetoclax preclinical toxicology. • Efficacy endpoint was modified to remove Time to Progression (TTP) and Progression Free Survival (PFS) and add Event Free Survival (EFS) throughout the protocol. • Leukemia response rate was updated to include MLFS. • Updated Sample List of Excluded and Cautionary Medications to change the classification of diltiazem from strong to moderate CYP3A inhibitor.
24 January 2018	<ul style="list-style-type: none"> • Update Efficacy Summaries section to add CRh rates and transfusion independence endpoints. • Updated Excluded and Cautionary Medications and Dietary Restrictions Table to remove weak CYP3A inhibitors, weak CYP3A inducers and OATP1B1/B3 inhibitors as these classes of drugs are no longer considered to be cautionary. • Updated list of Signatories for Protocol Amendment 4. • Update Appendix C, Sample List of Excluded and Cautionary Medications to remove examples of weak CYP3A inhibitors, weak CYP3A inducers and OATP1B1/B3 inhibitors, as these drugs are no longer considered to be cautionary.

22 March 2019	<p>The purpose of this amendment was:</p> <ul style="list-style-type: none"> • To extend allowable treatment period from 2 to 3 years from last subject enrolled in the study. • Update "from last subject enrolled" to "from last subject's last dose" when referring to the point at which post-treatment and survival assessments are conducted from. • To update the Post-Treatment/Survival follow-up visits to occur every 12 weeks (\pm 1 week) for 1 year from last subject's last dose. • To update survival period to occur every 12 weeks up to 1 year from last subject's last dose to reduce burden to subjects who are in long term follow up and no longer receiving study therapy. • To update Venetoclax Preclinical Toxicology and Clinical Data Rationale to be consistent with the IB v10.0. • Update Sample List of Excluded and Cautionary Medications to remove examples Azithromycin. The rationale for removal is the results of DDI study of azithromycin evaluating its effect on venetoclax PK, exposures of venetoclax did not change significantly.
17 February 2020	<p>The purpose of this amendment was to:</p> <ul style="list-style-type: none"> • To extend allowable treatment period from 3 to 4 years from last subject enrolled in the study. • To update Venetoclax Clinical Data Rationale to be consistent with the IB v12.0.
22 October 2020	<p>The purpose of this amendment was to:</p> <ul style="list-style-type: none"> • Benefits and Risks - included information on the re-evaluation of the benefit and risk with consideration of Coronavirus Disease 2019 present in subject's region. • Safety and Efficacy Measurements Assessed and Flow Chart - added instructions for necessary changes to activities or procedures in the event of temporary study [drug] interruption/halt. • Treatments Administered - included instructions that in the event the subject cannot pick up venetoclax onsite, DTP shipment can be done as needed and permitted by local regulations. • Protocol Deviations - clarified that protocol deviations may include modifications due to COVID-19. • Ethical Conduct of the Study - noted that AbbVie will modify the study protocol as necessary due to the pandemic. Investigators must also notify AbbVie if any urgent safety measures are taken. • Source Documents - noted that remote monitoring may be employed as needed. • Modified the language for survival and post treatment follow up time frames to permit a shorter duration of follow up if all patients have discontinued and most patients have expired.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
