

Clinical trial results:

An open label, single group assignment design study to correlate soluble ST2 with clinical, endoscopic and histological activity in moderate to severe Ulcerative Colitis patients under golimumab.

Summary

EudraCT number	2014-003262-25
Trial protocol	PT

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	05 September 2017
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	05 September 2017
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The purpose of this study is to evaluate serum soluble human ST2 protein, the receptor for Interleukin-33 (IL-33) and a member of the proinflammatory Interleukin-1 (IL-1) receptor superfamily, as a surrogate biological marker predictive of disease outcome and therapeutic response to golimumab treatment in participants with moderate to severe Ulcerative Colitis (UC) who have failed on prior conventional therapies. The primary endpoints of this study are to correlate serum soluble ST2 levels with endoscopic activity (endoscopic subscore of the Mayo score) and histological activity (Geboes index) of disease.

Protection of trial subjects:

This study was conducted in conformance with Good Clinical Practice standards and applicable country and/or local statutes and regulations regarding ethical committee review, informed consent, and the protection of human subjects participating in biomedical research.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	27 February 2015
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Portugal: 38
Worldwide total number of subjects	38
EEA total number of subjects	38

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	37

From 65 to 84 years	1
85 years and over	0

Subject disposition

Recruitment

Recruitment details: -

Pre-assignment

Screening details:

Participants with moderate to severe active UC with total Mayo score of 6 to 12, inclusive at baseline, and endoscopic Mayo sub-score, greater than or equal to 2.

Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Not applicable
Blinding used	Not blinded

Arms

Arm title	Golimumab treatment
-----------	---------------------

Arm description:

Golimumab 200 mg initially administered by subcutaneous (SC) injection at Week 0, followed by 100 mg at Week 2 and then 50 mg or 100 mg every 4 weeks (per prescribing information) up to 16 weeks.

Arm type	Experimental
Investigational medicinal product name	Golimumab
Investigational medicinal product code	
Other name	MK-8259; Simponi
Pharmaceutical forms	Injection
Routes of administration	Subcutaneous use

Dosage and administration details:

Golimumab 50mg/0.5 mL in a single-use, ready-to-use autoinjector. Golimumab is a fully human anti-tumor necrosis factor (anti-TNF) alpha monoclonal antibody that will be administered SC.

Number of subjects in period 1	Golimumab treatment
Started	38
Completed	29
Not completed	9
Adverse event, non-fatal	1
Lack of efficacy	6
Protocol deviation	2

Baseline characteristics

Reporting groups

Reporting group title	Golimumab treatment
-----------------------	---------------------

Reporting group description:

Golimumab 200 mg initially administered by subcutaneous (SC) injection at Week 0, followed by 100 mg at Week 2 and then 50 mg or 100 mg every 4 weeks (per prescribing information) up to 16 weeks.

Reporting group values	Golimumab treatment	Total	
Number of subjects	38	38	
Age categorical Units: Subjects			

Age Continuous Units: Years arithmetic mean standard deviation	34.8 ± 12.15	-	
Sex: Female, Male Units: Subjects			
Female	23	23	
Male	15	15	
Serum ST2 level Baseline			
ST2, a serum biomarker, was collected prior to study drug administration. Population consists of 34 participants with available serum ST2 data at baseline.			
Units: ng/mL arithmetic mean standard deviation	21.8 ± 11.09	-	
Serum ST2 level Week 6			
ST2, a serum biomarker, was collected prior to study drug administration. Population consists of 34 participants with available serum ST2 data at Week 6.			
Units: ng/mL arithmetic mean standard deviation	21.8 ± 14.41	-	
Serum ST2 level Week 16			
ST2, a serum biomarker, was collected prior to study drug administration. Population consists of 29 participants with available serum ST2 data at Week 16.			
Units: ng/mL arithmetic mean standard deviation	17.9 ± 13.10	-	

End points

End points reporting groups

Reporting group title	Golimumab treatment
Reporting group description: Golimumab 200 mg initially administered by subcutaneous (SC) injection at Week 0, followed by 100 mg at Week 2 and then 50 mg or 100 mg every 4 weeks (per prescribing information) up to 16 weeks.	
Subject analysis set title	Inactive disease
Subject analysis set type	Sub-group analysis

Primary: Correlation of serum soluble human Suppression of Tumorigenicity 2 (ST2) levels with endoscopic activity of disease (assessed by endoscopy subscore of Mayo score) at Week 6

End point title	Correlation of serum soluble human Suppression of Tumorigenicity 2 (ST2) levels with endoscopic activity of disease (assessed by endoscopy subscore of Mayo score) at Week 6 ^[1]
End point description: ST2, a serum biomarker, was collected prior to study drug administration. Endoscopic Mayo subscore is one of 4 components that comprise the total Mayo Score, a scale for assessing ulcerative colitis (UC) activity. Endoscopic Mayo subscore ranges from 0-3: 0 = normal or inactive disease, 1 = mild disease (erythema, decreased vascular pattern, mild friability); 2 = moderate disease (marked erythema, absent vascular pattern, friability, erosions); 3 = Severe disease (spontaneous bleeding, ulceration). A higher score indicates more severe disease. Moderate correlation was defined as a Spearman correlation (rs) coefficient between -0.5 to -0.3 or 0.3 to 0.5. Analysis population includes all participants who had received study medication, had at least one valid post-baseline assessment for the primary endpoint that correlates ST2 with endoscopic activity and/or histological activity, and had a Week 6 endoscopic Mayo subscore.	
End point type	Primary
End point timeframe: Week 6	
Notes: [1] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point. Justification: No between-group statistical analyses were planned for this endpoint.	

End point values	Golimumab treatment			
Subject group type	Reporting group			
Number of subjects analysed	34			
Units: Spearman correlation (rs) coefficient				
number (confidence interval 95%)	0.451 (0.133 to 0.685)			

Statistical analyses

No statistical analyses for this end point

Primary: Correlation of serum soluble ST2 levels with histological activity (assessed by Geboes index) at Week 6

End point title	Correlation of serum soluble ST2 levels with histological activity (assessed by Geboes index) at Week 6 ^[2]
-----------------	--

End point description:

ST2, a serum biomarker, was collected prior to study drug administration. Geboes index, is a validated score for evaluating histologic disease activity in UC as follows: grade 0 = structural and architectural changes; grade 1 = chronic inflammatory infiltrate; grade 2 = lamina propria neutrophils and eosinophils; grade 3 = neutrophils in the epithelium; grade 4 = crypt destruction; grade 5 = erosions or ulceration. A higher score indicates more severe disease. Moderate correlation was defined as rs coefficient between -0.5 to -0.3 or 0.3 to 0.5. Analysis population includes all participants who had received study medication, had at least one valid post-baseline assessment for the primary endpoint that correlates ST2 with endoscopic activity and/or histological activity, and had a Week 6 Geboes index score.

End point type	Primary

subjects affected / exposed	4 / 38 (10.53%)		
occurrences (all)	4		

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
11 August 2015	Amendment 1: major revisions to the protocol included the following: <ul style="list-style-type: none">• prolonging the screening period, to allow participants who are diagnosed during screening period with latent tuberculosis to receive treatment that is consistent with local guidelines before starting the study drug;• updating the Tuberculosis assessment wording to clarify clinical situations that were not described in the original protocol;• allow re-screening for participants in a very specific case, namely, participants who fail to meet the inclusion/exclusion criteria related with the severity of the disease.
18 February 2016	Amendment 2: major revisions to the protocol include the following <ul style="list-style-type: none">• removal of the procedure "tuberculin skin test" due to its shortage in Portugal and after consultation with the regulatory authority;• inclusion of the procedure "evaluation of latent tuberculosis by specialized, trained, and licensed personnel", at screening visit if not available within 2 months prior to study inclusion.
21 April 2017	Amendment 3: major revision to the protocol included the following: <ul style="list-style-type: none">• addition of the procedure "measurement of serum golimumab levels and anti-golimumab antibodies".
