Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	04 December 2016
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	17 October 2016
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The primary objective of the study is to assess the ability of different Dupilumab dose regimens, administered as monotherapy, to maintain the treatment response achieved after 16 weeks of initial treatment with Dupilumab monotherapy compared to placebo.

Protection of trial subjects:

This study was conducted in accordance with the ethical principles that have their origin in the Declaration of Helsinki and that are consistent with the International Conference on Harmonisation (ICH) guidelines for Good Clinical Practice (GCP) and applicable regulatory requirements.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	24 March 2015
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Poland: 19
Country: Number of subjects enrolled	Spain: 22
Country: Number of subjects enrolled	United Kingdom: 6
Country: Number of subjects enrolled	Bulgaria: 6
Country: Number of subjects enrolled	Denmark: 7
Country: Number of subjects enrolled	Estonia: 17
Country: Number of subjects enrolled	France: 16
Country: Number of subjects enrolled	Germany: 63
Country: Number of subjects enrolled	Italy: 9
Country: Number of subjects enrolled	Lithuania: 7
Country: Number of subjects enrolled	Korea, Republic of: 24

EEA total number of subjects	172

Notes:

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	397
From 65 to 84 years	25
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

The study was conducted in 15 countries between 25 March 2015 and 18 October 2016. A total of 422 subjects were randomized in the study.

Pre-assignment

Screening details:

Out of the 475 enrolled subjects, 422 were randomized and 420 received either placebo or Dupilumab. Subjects were randomized in 2:1:1:1 ratio to receive Dupilumab 300 milligram (mg) once weekly/twice weekly (QW/Q2W), Dupilumab 300 mg four times a week (Q4W), Dupilumab 300 mg eight times a week (Q8W) and Placebo.

Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Assessor

Arms

Are arms mutually exclusive?	Yes
Arm title	Placebo QW

Arm description:

Subcutaneous injection of Placebo (for Dupilumab) was administered weekly (QW) from Week 1 (Day 1) to Week 36.

Arm type	Placebo
Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection
Routes of administration	Subcutaneous use

Dosage and administration details:

Subcutaneous injection among the different quadrants of the abdomen (avoiding navel and waist areas), upper thighs, and upper arms.

Arm title	Dupilumab 300 mg Q8W
------------------	----------------------

Arm description:

Subcutaneous injection of Dupilumab 300 mg alternatively with placebo (matched to Dupilumab) once every eight week (Q8W) from Week 1 to Week 36.

Arm type	Experimental
Investigational medicinal product name	Dupilumab 300 mg
Investigational medicinal product code	REGN668
Other name	SAR231893
Pharmaceutical forms	Solution for injection
Routes of administration	Subcutaneous use

Dosage and administration details:

Subcutaneous injection among the different quadrants of the abdomen (avoiding navel and waist areas), upper thighs, and upper arms.

Arm title	Dupilumab 300 mg Q4W
------------------	----------------------

Arm description:

Subcutaneous injection of Dupilumab 300 mg alternatively with placebo (matched to Dupilumab) once every four week (Q4W) from Week 1 to Week 36.

Arm type	Experimental
----------	--------------

Investigational medicinal product name	Dupilumab
Investigational medicinal product code	REGN668
Other name	SAR231893
Pharmaceutical forms	Solution for injection
Routes of administration	Subcutaneous use

Dosage and administration details:

Subcutaneous injection among the different quadrants of the abdomen (avoiding navel and waist areas), upper thighs, and upper arms.

Arm title	Dupilumab 300 mg Q2W/QW
------------------	-------------------------

Arm description:

Subcutaneous injection of Dupilumab 300 mg alternatively with placebo (matched to Dupilumab) once every week (QW) or twice a week (Q2W) from Week 1 to Week 36.

Arm type	Experimental
Investigational medicinal product name	Dupilumab
Investigational medicinal product code	REGN668
Other name	SAR231893
Pharmaceutical forms	Solution for injection
Routes of administration	Subcutaneous use

Dosage and administration details:

Subcutaneous injection among the different quadrants of the abdomen (avoiding navel and waist areas), upper thighs, and upper arms.

Region of Enrollment			
Units: Subjects			
North America	38	39	38
Japan	12	11	12
Europe	33	34	36
Eczema Area and Severity Index (EASI) score			
The EASI score was used to measure the severity and extent of atopic dermatitis (AD) and measured erythema, infiltration, excoriation and lichenification on 4 anatomic regions of the body: head, trunk, upper and lower extremities. The total EASI score range from 0 (minimum) to 72 (maximum) points, with the higher scores reflecting the worse severity of AD.			
Units: units on a scale			
arithmetic mean	2.5	2.3	2.8
standard deviation	± 2.31	± 2.33	± 3.31
Weekly Average of Peak Daily Pruritus Numerical Rating Scale (NRS)			
Pruritus NRS scale is an assessment tool that is used to report the intensity of subjects's pruritus (itch), both maximum and average intensity, during a 24-hour recall period. Subjects were asked the following question: how would a subject rate his itch at the worst moment during the previous 24 hours (for maximum itch intensity on a scale of 0 – 10 [0= no itch; 10= worst itch imaginable]).			
Units: units on a scale			
arithmetic mean	2.8	2.7	3.1
standard deviation	± 2.11	± 2.27	± 2.16
Body Surface Area (BSA) Involvement with AD			
Body surface area affected by AD was assessed for each section of the body (the possible highest score for each region was: head and neck [9%], anterior trunk [18%], back [18%], upper limbs [18%], lower limbs [36%], and genitals [1%]). It was reported as a percentage of all major body sections combined.			
Units: percentage of body surface area			
arithmetic mean	8.1	7.9	9.3
standard deviation	± 8.21	± 9.04	± 10.51
SCORing Atopic Dermatitis (SCORAD) score			
SCORAD was a clinical tool for assessing the severity of AD developed by the European Task Force on Atopic Dermatitis (Severity scoring of atopic dermatitis: the SCORAD index). Consensus Report of the European Task Force on Atopic Dermatitis. Dermatology (Basel) 186 (1): 23–31. 1993. Extent and intensity of eczema as well as subjective signs (insomnia, etc.) were assessed and scored. Total score ranges from 0 (absent disease) to 103 (severe disease).			
Units: units on a scale			
arithmetic mean	16.8	17.1	17.5
standard deviation	± 10.03	± 9.41	± 10.59
Patient Oriented Eczema Measure (POEM)			
The POEM was a 7-item questionnaire that assessed disease symptoms (dryness, itching, flaking, cracking, sleep loss, bleeding and weeping) with a scoring system of 0 (absent disease) to 28 (severe disease) (high score indicative of poor quality of life [QOL]).			
Units: units on a scale			
arithmetic mean	6.1	6.8	6.1
standard deviation	± 5.43	± 5.88	± 5.11
Dermatology Life Quality Index (DLQI)			

Score			
The DLQI is a 10-item, validated questionnaire used in clinical practice and clinical trials to assess the impact of AD disease symptoms and treatment on QOL. The 10 questions assessed QOL over the past week, with an overall scoring of 0 (absent disease) to 30 (severe disease); a high score indicative of a poor QOL.			
Units: units on a scale			
arithmetic mean	3.4	3	3.2
standard deviation	± 4.25	± 3.76	± 3.93
Total Hospital Anxiety Depression Scale (HADS)			
The HADS is a fourteen item scale. Seven of the items relate to anxiety and seven relate to depression. Each item on the questionnaire is scored from 0-3 and this means that a person can score between 0 (no symptoms) and 21 (severe symptoms) for either anxiety or depression. Cut-offs for identifying psychiatric distress has been reported as 7 to 8 for possible presence, 10 to 11 for probable presence, and 14 to 15 for severe anxiety or depression.			
Units: units on a scale

Any untoward medical occurrence in a subject who received investigational medicinal product (IMP) was considered an AE without regard to possibility of causal relationship with this treatment. Treatment-emergent adverse events (TEAEs) were defined as AEs that developed or worsened or became serious during on- treatment period (time from the first dose of study drug up to the end of study [Week 36]). A serious adverse event (SAE) was defined as any untoward medical occurrence that resulted in any of the following outcomes: death, life- threatening, required initial or prolonged in-patient hospitalization, persistent or significant disability/incapacity, congenital anomaly/birth defect, or considered as medically important event. Any TEAE included subjects with both serious and non-serious AEs. FAS population was used.

Secondary: Percentage of Well-Controlled Weeks During the On-treatment Period

End point title	Percentage of Well-Controlled Weeks During the On-treatment Period
End point description:	
Well-controlled weeks are those in which subjects during their weekly IVRS call completion has their eczema been well-controlled over the last week during which no rescue treatments were administered. Percentage of well-controlled weeks during the on-treatment period were reported. The safety analysis set (SAF) included all randomized subjects who received any amount of study drug. Here, number of subjects analyzed = subjects with available data for this endpoint.

Adverse events

Adverse events information

Timeframe for reporting adverse events:

All Adverse Events (AEs) were collected from signature of the informed consent form up to the final visit (Week 36) regardless of seriousness or relationship to investigational product.

Adverse event reporting additional description:

Reported AEs are treatment-emergent adverse events that developed/worsened during the 'on-treatment period' (time from the first dose of study drug up to the end of study [Week 36]). The safety analysis set (SAF) included all randomized subjects who received any amount of study drug.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
09 February 2015	Following changes were made: Added text to indicate that for background treatment with moisturizers (emollients), to allow adequate assessment of skin dryness, moisturizers should not be applied on the area(s) of non-lesional skin designated for such assessments for at least 8 hours before each clinic visit, • Changed the terminology of "European Medicines Agency (EMA) reference market" to "European Union (EU) reference market," and to add Japan to the countries that will use the co-primary endpoints, • Changed "other endpoints" to "other secondary endpoints" for clarity and consistency with the terminology used in the parent studies (R668-AD-1334 and -1416), • Moved the endpoint "change in SCORing Atopic Dermatitis (SCORAD) from baseline to week 36" from key secondary endpoints section to the "other secondary endpoints" section, and revised the endpoint from "change ... from baseline ..." to "percent change ... from baseline ..." • Added per protocol set (PPS) for efficacy analysis, • Clarified the description, using language consistent with that used in the parent studies (R668-AD-1334 and -1416), of methods for missing data imputation (multiple imputation [MI] Statistical Analysis Software [SAS] procedure with Markov Monte Carlo algorithm) and data analysis.
22 February 2015	<ul style="list-style-type: none">• Clarified that subjects who completed the end of treatment visit in SOLO-1 (R668 AD 1334) and SOLO-2, (R668-AD-1416) and who fulfill eligibility criteria, were enrolled in the current study, • Further clarified the definition of adequate birth control for sexually active women of reproductive potential in the "Exclusion Criteria" • Provided more specific guidance on escalation of rescue treatment, • Updated information regarding infections requiring systemic treatment under "Reasons for Temporary Discontinuation of Study Drug" to improve clarity and accuracy, as oral treatment was also a systemic route of administration, • Added an additional restriction to "Prohibited Medications and Procedures" to include all atopic dermatitis (AD) treatments, including off-label treatments, with the exception of those specifically allowed in the protocol, • Removed ACQ-5 and Sinonasal Outcome Test (SNOT)-22 questionnaires from the study visit descriptions of visit 4 and visit 7 to align with the schedule of events • Corrected study drug administration up through week 35, instead of week 36 • Changed the anti-drug antibody (ADA) variables and text throughout the protocol to distinguish between transient and persistent ADA responses, • Made changes throughout the protocol to the follow-up of subjects with positive ADA titer at their last study visit to ensure that subjects with ADA positive titer were not lost to follow-up, • Provided text to clarify the relationship between rescue medications and prohibited medications, • Increased the clarity and accuracy of the conditions for the early termination visit, • Clarified that the sample size was an estimate, based on the anticipated number of eligible subjects enrolled from the SOLO-1 (R668-AD-1334) and SOLO-2 (R668-AD-1416) clinical trials, and not based on a predefined quota.

11 October 2016	<p>The purpose of amendment 3 was to update and revised the protocol sections addressing study endpoints and statistical considerations, and to ensure concordance with the final Statistical Analysis Plan (SAP). The primary objective of the study was to assess the ability of different Dupilumab dose regimens, administered as monotherapy, to maintain the treatment response achieved after 16 weeks of initial treatment. One of the current co-primary endpoints, IGA(0,1) had been helpful to assess initial treatment response but lacks adequate sensitivity to optimally characterize maintenance of response over time for different dosing regimens. As such, a more sensitive co-primary endpoint had been selected to better support the above study objective. The main changes were as follows:</p> <ul style="list-style-type: none"> • Downgraded the Investigator's Global Assessment (IGA)(0,1) from co-primary to a key secondary endpoint. This endpoint could not be analyzed in the entire randomized population (required subset analysis in subjects with IGA 0,1 at baseline), it did not adequately characterize Dupilumab's clinical effect over time, and it lacked the sensitivity necessary to support the objective of the study, which was to differentiate between the treatment groups analyzed with respect to maintenance vs. loss of response • Added a co-primary endpoint based on percent change in Eczema Area and Severity Index (EASI) score, which was analyzed in the entire randomized population (full analysis set [FAS]). This endpoint provided improved sensitivity to differentiate between maintenance vs. loss of response and better support for the study objective. • Changed the statistical testing methodology of multiplicity control, ie, from parallel testing of each of the 3 dose groups vs. placebo (with a 3-way alpha split and 0.0167 significance level) to hierarchical testing at a 0.05 significance level.
