Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	11 April 2016
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	11 April 2016
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The main objective of this study was to determine the efficacy of a treatment regimen of simeprevir in combination with daclatasvir, as measured by sustained virologic response (SVR) at 12 weeks after actual end of treatment (EOT) (SVR12), in treatment-naïve, chronic hepatitis C virus (HCV) genotype 1b-infected subjects who had advanced fibrosis or compensated cirrhosis (corresponding to METAVIR F3/F4).

Protection of trial subjects:

Safety evaluations included the monitoring of adverse events (AEs), clinical laboratory test results, vital sign measurements, and physical examinations. An electrocardiogram (ECG) was performed during screening.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	14 January 2015
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Belgium: 12
Country: Number of subjects enrolled	Germany: 20
Country: Number of subjects enrolled	Spain: 20
Country: Number of subjects enrolled	France: 25
Country: Number of subjects enrolled	United Kingdom: 1
Country: Number of subjects enrolled	Hungary: 12
Country: Number of subjects enrolled	Italy: 16
Worldwide total number of subjects	106
EEA total number of subjects	106

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0

Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	75
From 65 to 84 years	31
85 years and over	0

Subject disposition

Recruitment

Recruitment details: -

Pre-assignment

Screening details:

In total, 197 subjects were screened. Of these, 106 subjects (53.8%) were treated (Cohort 1 exclusively). In Cohort 1, 21.3% of the subjects (42/197) were screening failures, and 1 subject was enrolled but not treated.

Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Non-randomised - controlled
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
Arm title	12 Weeks Prior Amendment

Arm description:

Simeprevir 150 milligram (mg) once daily as an oral capsule in combination with Daclatasvir 60 mg once daily as an oral tablet for subjects who completed the 12-week treatment before Amendment 3 of the protocol was implemented.

Arm type	Experimental
Investigational medicinal product name	Simeprevir
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Capsule
Routes of administration	Oral use

Dosage and administration details:

Simeprevir 150 milligram (mg) once daily as an oral capsule for subjects who completed the 12-week treatment before Amendment 3 of the protocol was implemented.

Investigational medicinal product name	Daclatasvir
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

Daclatasvir 60 mg once daily as an oral tablet for subjects who completed the 12-week treatment before Amendment 3 of the protocol was implemented.

Arm title	12 Weeks Post Amendment
------------------	-------------------------

Arm description:

Simeprevir 150 mg once daily as an oral capsule in combination with Daclatasvir 60 mg once daily as an oral tablet for subjects who opted for a 12-week treatment period after amendment.

Arm type	Experimental
Investigational medicinal product name	Simeprevir

Primary: Percentage of Subjects With Sustained Virologic Response 12 Weeks After end of Study Drug Treatment (SVR12)

End point title	Percentage of Subjects With Sustained Virologic Response 12 Weeks After end of Study Drug Treatment (SVR12) ^[1]
End point description: Subjects were considered to have reached SVR12, if 12 weeks after the actual end of treatment (EOT), hepatitis C virus (HCV) ribonucleic acid (RNA) was less than lower limit of quantification (<LLOQ) (detectable or undetectable). The intent-to-treat (ITT) analysis set is defined as all subjects who received at least one dose of simeprevir or daclatasvir.	
End point type	Primary
End point timeframe: At 12 weeks after end of treatment	

Notes:

[1] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: For this outcome measure, there was no formal statistical comparison to an internal control group. Instead, overall responses were estimated using point and interval estimation and the SVR12 rate was compared with an historical control of simeprevir and PegIFN/RBV treatment in subjects with HCV genotype 1b infection and advanced fibrosis or compensated cirrhosis (Cohort 1).

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
02 March 2015	The amendment INT-2 included the following changes: Investigators had suggested to expand the study to include additional patient populations, in particular patients who had less advanced liver fibrosis (corresponding to METAVIR F0 F2), those who had hepatitis C virus (HCV) genotype 4, and those who had human immunodeficiency virus (HIV) or HCV coinfection. For both patient populations, interferon (IFN) -free options were still limited either due to restricted access or to lack of data. Both simeprevir and daclatasvir have individually shown to be active against HCV genotype 4 in Phase 3 clinical studies with pegylated interferon (PegIFN) and ribavirin (RBV), and are approved for the treatment of adult patients with HCV genotype 4. Increasing evidence indicated that the efficacy and safety of IFN free therapy was similar in HCV-infected patients with or without HIV coinfection. Hepatitis C virus therapy in HIV-/HCV-coinfected patients therefore had to follow the same treatment recommendations as in mono-infected patients, provided that potential drug interactions between HIV and HCV treatments were considered. Patients who had mild fibrosis, HCV genotype 4, and/or HCV/HIV coinfection continue to be under treated patient populations to understand the efficacy and safety of treatment with simeprevir in combination with daclatasvir. Additionally, the period after the end of therapy during which subjects were required to adhere to contraception requirements and sperm donation restrictions was extended, based on nonclinical embryotoxicity and teratogenicity information for daclatasvir.
01 June 2015	The amendment INT-3 included the following changes: 1) Sponsor's decision to discontinue Cohort 2 (METAVIR F0-F2 treatment-naïve subjects who had genotype 1b infection) due to prompted concern that viral breakthrough could also be observed in subjects with HCV genotype 1b infection and mild-to-moderate fibrosis because Viral breakthroughs were observed in the early phase of Cohort 1 (METAVIR F3/F4 treatment naïve subjects with HCV genotype 1b infection), 2) Discontinuation of Cohort 3 due to the observed cases of viral breakthrough in a HCV genotype 1b population without baseline mutations L31M/V and Y93H, it could no longer be excluded with certainty that viral breakthrough could also be observed in HCV genotype 4, 3) Since no subjects with HIV were enrolled, information related to inclusion of HIV subjects, including concomitant therapy allowed, was no longer necessary, 4) collection of blood samples and analyses of pharmacokinetics, HIV viral load, and efficacy related to HIV and combination antiretroviral therapy (cART) were not collected/performed at time points after screening, 5) Extended required wash-out period for amiodarone to 120 days prior to baseline due its long half life, 6) Physical examination data were not recorded on the electronic case report form (eCRF); therefore no analyses of the data were performed, 7) clarified statistical methods for the primary analysis for Cohort 1, 8) Minor errors were noted or minor editorial changes made.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

Due to the implementation of Amendment 3 while treatment was ongoing, subjects received different treatment durations in a nonrandomized fashion. Therefore, no firm conclusions could be made about the optimal treatment duration for specific subjects.
