

## Clinical trial results:

### Open Label Study to Evaluate the Effect, Safety and Tolerability of 250µg (8 MIU) Interferon Beta 1b (Betaferon) Given Subcutaneously Every Other Day (for 24 Weeks) in Patients of Chinese Origin With Multiple Sclerosis

#### Summary

EudraCT number	2014-004613-93
Trial protocol	Outside EU/EEA
Global end of trial date	26 September 2008

#### Results information

Result version number	v2 (current)
This version publication date	07 September 2016
First version publication date	05 July 2015
Version creation reason	<ul style="list-style-type: none"><li>• New data added to full data set</li><li>• Correction of full data set</li></ul> Bayer sponsor contact information to be updated

#### Trial information

##### Trial identification

Sponsor protocol code	BAY86-5046/91386
-----------------------	------------------

##### Additional study identifiers

ISRCTN number	-
ClinicalTrials.gov id (NCT number)	NCT00370071
WHO universal trial number (UTN)	-
Other trial identifiers	Protocol number: 308720, Other: MP-00102

Notes:

#### Sponsors

Sponsor organisation name	Bayer AG
Sponsor organisation address	Kaiser-Wilhelm-Allee, D-51368, Leverkusen, Germany,
Public contact	Therapeutic Area Head, Bayer AG, clinical-trials-contact@bayer.com
Scientific contact	Therapeutic Area Head, Bayer AG, clinical-trials-contact@bayer.com

Notes:

#### Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	Yes

Notes:

## Results analysis stage

Analysis stage	Final
Date of interim/final analysis	26 September 2008
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	26 September 2008
Was the trial ended prematurely?	No

Notes:

## General information about the trial

Main objective of the trial:

The primary objective of this study was to demonstrate that interferon beta 1b treatment in multiple sclerosis (MS) subjects of Chinese origin positively impacts on the course of their disease as evidenced by magnetic resonance imaging (MRI).

Protection of trial subjects:

The conduct of this clinical study met all local legal and regulatory requirements. The study was conducted in accordance with the ethical principles that have their origin in the Declaration of Helsinki and the International Conference on Harmonization guideline E6: Good Clinical Practice. Before entering the study, the informed consent form was read by and explained to all subjects and/or their legally authorized representative. Participating subjects and/or their legally authorized representative signed informed consent form and could withdraw from the study at any time without any disadvantage and without having to provide a reason for this decision. Only investigators qualified by training and experience were selected as appropriate experts to investigate the study drug.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	08 November 2006
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

## Population of trial subjects

### Subjects enrolled per country

Country: Number of subjects enrolled	China: 39
Worldwide total number of subjects	39
EEA total number of subjects	0

Notes:

### Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	1

Adults (18-64 years)	38
From 65 to 84 years	0
85 years and over	0

## Subject disposition

### Recruitment

Recruitment details:

The study was conducted in China between 08 November 2006 (first subject first visit) and 26 September 2008 (last subject last visit).

### Pre-assignment

Screening details:

After a 3-month pre-treatment period with no MS-specific treatment, 39 subjects entered the 6-month treatment period. Of the 84 subjects screened, 40 subjects did not meet the inclusion/exclusion criteria, 3 subjects withdrew their consent, and 2 subjects died during pre-treatment.

### Period 1

Period 1 title	Overall trial (overall period)
Is this the baseline period?	Yes
Allocation method	Not applicable
Blinding used	Not blinded

### Arms

<b>Arm title</b>	Interferon Beta-1b (Betaseron, BAY86-5046)
------------------	--

Arm description:

Interferon Beta-1b 250 micrograms (8 MIU [million international units]) subcutaneously every other day.

Arm type	Experimental
Investigational medicinal product name	Interferon Beta-1b
Investigational medicinal product code	BAY86-5046
Other name	Betaseron, Betaferon
Pharmaceutical forms	Injection
Routes of administration	Subcutaneous use

Dosage and administration details:

Interferon Beta-1b 250 micrograms (8 MIU) subcutaneously every other day.

<b>Number of subjects in period 1</b>	Interferon Beta-1b (Betaseron, BAY86-5046)
Started	39
Completed	37
Not completed	2
Consent withdrawn by subject	2

## Baseline characteristics

### Reporting groups

Reporting group title	Interferon Beta-1b (Betaseron, BAY86-5046)
Reporting group description: Interferon Beta-1b 250 micrograms (8 MIU [million international units]) subcutaneously every other day.	

Reporting group values	Interferon Beta-1b (Betaseron, BAY86-5046)	Total	
Number of subjects	39	39	
Age categorical Units: Subjects			

Age continuous Units: years arithmetic mean full range (min-max)	31.6 17 to 58	-	
Gender categorical Units: Subjects			
Female	26	26	
Male	13	13	
Gadolinium enhancing lesions (T1) at screening Units: Subjects			
no lesions	5	5	
1-3 lesions	23	23	
≥ 4 lesions	11	11	
Type of Multiple Sclerosis Units: Subjects			
Relapsing-remitting (RR)	36	36	
Secondary progressive (SP)	3	3	
Expanded disability status scale at screening (EDSS)			
The EDSS is a scale based on the standardized neurological examination which comprised of optic, brain stem/cranial nerves, pyramidal, cerebellar, sensory, vegetative, and cerebral functions, as well as walking ability. The EDSS scores range from 0.0 (normal) to 10.0 (dead). A score of 2 to 3 indicates minimal to moderate disability.			
Units: Scores on a scale arithmetic mean full range (min-max)	2.26 0 to 5	-	
New Gd-enhancing lesions during 3-month pre-treatment Units: Lesions arithmetic mean standard deviation	2.6 ± 4.1	-	
New or enlarging T2 lesions during 3-month pre-treatment Units: Lesions arithmetic mean	2.2		

standard deviation	$\pm 3.2$	-	
Newly active lesions during 3-month pre-treatment			
Units: Lesions			
arithmetic mean	4.8		
standard deviation	$\pm 7.1$	-	
Previous Multiple Sclerosis relapses			
Units: relapses			
arithmetic mean	2.8		
standard deviation	$\pm 1.7$	-	
T2 lesions at screening			
Units: Lesions			
arithmetic mean	45.1		
standard deviation	$\pm 32.9$	-	
Time since onset of Multiple Sclerosis			
Units: Years			
arithmetic mean	3.5		
standard deviation	$\pm 4.6$	-	

## End points

### End points reporting groups

Reporting group title	Interferon Beta-1b (Betaseron, BAY86-5046)
-----------------------	--

Reporting group description:

Interferon Beta-1b 250 micrograms (8 MIU [million international units]) subcutaneously every other day.

Subject analysis set title	Full analysis set (FAS)
----------------------------	-------------------------

Subject analysis set type	Full analysis
---------------------------	---------------

Subject analysis set description:

FAS (N=39) was defined as all subjects with receipt of at least one dose of study medication and at least one post-baseline visit.

Subject analysis set title	MRI set (MRS)
----------------------------	---------------

Subject analysis set type	Full analysis
---------------------------	---------------

Subject analysis set description:

MRS (N=39) included all FAS subjects with at least one evaluable post-baseline MRI scan.

### Primary: Difference Between the Number of Newly Active Lesions in Magnetic Resonance Imaging (MRI) Per Three Months During the 6-month Treatment Period and the Number of Newly Active Lesions During 3-month Pre-treatment

End point title	Difference Between the Number of Newly Active Lesions in Magnetic Resonance Imaging (MRI) Per Three Months During the 6-month Treatment Period and the Number of Newly Active Lesions During 3-month Pre-treatment <sup>[1]</sup>
-----------------	---

End point description:

The primary efficacy variable was calculated by subtracting the number of newly active lesions during the 3-month pre-treatment period from the cumulative number of newly active lesions during the 6-month treatment period divided by 2 (number of newly active lesions per three months, new lesion frequency per 3 months).

End point type	Primary
----------------	---------

End point timeframe:

After 6 months of treatment as compared to 3-month pre-treatment

Notes:

[1] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: EudraCT database does not allow reporting statistics for a reporting group in a single-arm study. Due to this format constraint, we have uploaded charts with the accurate details of statistical analysis for this endpoint. Please find the statistical analyses in the attachment below.

<b>End point values</b>	Interferon Beta-1b (Betaseron, BAY86-5046)			
Subject group type	Reporting group			
Number of subjects analysed	38 <sup>[2]</sup>			
Units: Lesions				
median (full range (min-max))	-1.5 (-35 to 6.5)

## Statistical analyses

No statistical analyses for this end point

## Secondary: Assessment of Relapses: Relapse Rate

End point title	Assessment of Relapses: Relapse Rate
-----------------	--------------------------------------

End point description:

A relapse was defined as the appearance of a new neurological abnormality or worsening of previously stable or improving pre-existing neurological abnormality, separated by at least 30 days from onset of a preceding clinical event. The abnormality must be present for at least 24 hours and occur in the absence of fever (axillary temperature more than (>) 37.5 degree celsius / 99.5 degree fahrenheit) or known infection. A relapse must be confirmed by a documented report from a physician or by objective assessment. The relapse rate was calculated on an annualized basis. Annualized relapse rate is the average number of relapses in a year calculated by negative binomial regression as the sum of confirmed relapses of all subjects in the group divided by the sum of the number of days on study of all subjects in the group and multiplied by 365.25.

End point type	Secondary
----------------	-----------

End point timeframe:

Baseline up to Week 24

<b>End point values</b>	Interferon Beta-1b (Betaseron, BAY86-5046)			
Subject group type	Reporting group

## Secondary: Assessment of Relapses: Relapse Severity

End point title	Assessment of Relapses: Relapse Severity
-----------------	--

End point description:

A relapse was defined as the appearance of a new neurological abnormality or worsening of previously stable or improving pre-existing neurological abnormality, separated by at least 30 days from onset of a preceding clinical event. The abnormality must be present for at least 24 hours and occur in the absence of fever (axillary temperature >37.5 degree celsius / 99.5 degree fahrenheit) or known infection. A relapse must be confirmed by a documented report from a physician or by objective assessment. A major relapse was defined based on changes on EDSS with the following additional criteria to be met: objective neurological impairment, correlating with the subject's reported symptoms, defined as either increase in at least one of the functional systems of the EDSS score or increase of the total EDSS score. Relapses which did not meet the criteria of major relapses were considered as non-major.

End point type	Secondary

Date	Amendment
16 August 2007	<ol style="list-style-type: none"><li>1. Updated the list of study personnel and central laboratories: Administrative changes related to study personnel and central laboratories were described.</li><li>2. Update of the enrollment period: The expected enrollment period was extended from the 1st quarter of 2007 to the 3rd quarter of 2007.</li><li>3. Modification of inclusion criterion 2 (Subject's age): The minimum age for study participation was lowered from 18 to 16 years to reflect the Betaferon label change in Europe.</li><li>4. Modification of exclusion criterion 15 (prohibited medication before study start): Clarification was provided that certain medication was prohibited within 30 days prior to informed consent (instead of 30 days prior to first application of the study medication). This change made exclusion criterion 15 consistent with other sections of the protocol.</li><li>5. Clarification on documentation-requirements for relapse associated serious adverse events (SAEs): Clarification was provided that, even though hospitalization due to steroid treatment of a relapse was not to be recorded as an SAE, all other events meeting the seriousness criteria were to be reported appropriately as SAEs whether connected to a relapse of the disease or not.</li><li>6. Pretreatment MRI activity check: It was clarified that pretreatment MRI scans were centrally analyzed to determine the number of active lesions before completion of enrollment in order to verify the correctness of the assumptions made with respect to the baseline-to-treatment-comparison trial design.</li><li>7. Implementation of safety interim analysis: This safety interim analysis was implemented to allow early analysis and reporting of safety data in this Chinese study population.</li><li>8. Use of subject diaries: The protocol amendment provided guidance on diary dispensing, use and return.</li><li>9. Additional secondary MRI variable: The volume of Gd-enhancing lesions was introduced as additional secondary variable to allow determination of the disease burden.</li></ol>

Notes:

### Interruptions (globally)

Were there any global interruptions to the trial? No

### Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

Decimal places were automatically truncated if last decimal equals zero.

Notes:
