Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	13 December 2018
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	17 November 2018
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

To demonstrate the superiority of the insulin glargine/lixisenatide fixed ratio combination (FRC) versus GLP-1 receptor agonist (GLP-1 RA) in hemoglobin A1c (HbA1c) change from Baseline to Week 26.

Protection of trial subjects:

Subjects were fully informed of all pertinent aspects of the clinical trial as well as the possibility to discontinue at any time in language and terms appropriate for the subject and considering the local culture. During the course of the trial, subjects were provided with individual subject cards indicating the nature of the trial the subject was participating, contact details and any information needed in the event of a medical emergency. Collected personal data and human biological samples were processed in compliance with the Sanofi-Aventis Group Personal Data Protection Charter ensuring that the Group abides by the laws governing personal data protection in force in all countries in which it operates.

Background therapy:

Oral anti-diabetic (OAD) treatment metformin, pioglitazone, and sodium-glucose co-transporter 2 (SGLT2) inhibitors (canagliflozin, dapagliflozin, empagliflozin) was used as background therapy.

Evidence for comparator: -

Actual start date of recruitment	06 July 2016
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Romania: 62
Country: Number of subjects enrolled	Slovakia: 75
Country: Number of subjects enrolled	Spain: 48
Country: Number of subjects enrolled	Estonia: 13
Country: Number of subjects enrolled	Germany: 20
Country: Number of subjects enrolled	Canada: 23
Country: Number of subjects enrolled	Israel: 17
Country: Number of subjects enrolled	Italy: 33
Country: Number of subjects enrolled	United States: 223
Worldwide total number of subjects	514
EEA total number of subjects	251

Notes:

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	334
From 65 to 84 years	180
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

The study was conducted at 112 sites in 9 countries. A total of 840 subjects were screened between 06 July 2016 and 01 November 2017, of which 326 were screen failures. Screen failures were mainly due to glycated hemoglobin (HbA1c) level lesser than (<) 7% or more than (>) 9% at screening visit.

Pre-assignment

Screening details:

A total of 514 subjects were randomized in 1:1 (Insulin Glargine/Lixisenatide FRC or GLP-1 RA) ratio. Randomization was stratified by values of HbA1c at screening (=8%) & GLP-1 RA subtype at screening (once/twice daily [QD/BID], once weekly [QW] formulations).

Period 1

Period 1 title	Core Period: 26 Weeks
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
Arm title	Insulin Glargine/Lixisenatide Fixed Ratio Combination (FRC)

Arm description:

FRC injected subcutaneously QD for 26 weeks on top of oral anti-diabetic drug (OAD) therapy. Dose individually adjusted.

Arm type	Experimental
Investigational medicinal product name	Insulin glargine/lixisenatide fixed-ratio combination
Investigational medicinal product code	HOE901/AVE0010
Other name	Soliqua
Pharmaceutical forms	Solution for injection in pre-filled pen
Routes of administration	Subcutaneous use

Dosage and administration details:

FRC was self-administered with a pre-filled disposable SoloStar® pen-injector. Dose of the combination was titrated according to the subject's need for insulin. FRC was given QD in the morning in the hour (0 to 60 minutes) before breakfast. Dose was individually titrated throughout the study to reach and maintain fasting SMPG: 80-100 milligrams per deciliter (mg/dL) (4.4 - 5.6 millimoles per litre [mmol/L]) avoiding hypoglycemia.

Arm title	GLP-1 Receptor Agonist
------------------	------------------------

Arm description:

GLP-1 RA receptor agonist (liraglutide QD, exenatide BID, exenatide extended-release QW, albiglutide QW, or dulaglutide QW) injected subcutaneously for 26 weeks on top of OAD therapy. GLP-1 RAs were administered as per local labeling at the same dose schedule as prior to randomisation.

Arm type	Active comparator
Investigational medicinal product name	Liraglutide
Investigational medicinal product code	
Other name	Victoza®
Pharmaceutical forms	Solution for injection in pre-filled pen
Routes of administration	Subcutaneous use

Dosage and administration details:

QD at any time of day, independently of meals. Victoza is a marketed product and the dose used was in accordance with labeling document.

Investigational medicinal product name	Exenatide
Investigational medicinal product code	
Other name	Byetta®
Pharmaceutical forms	Solution for injection in pre-filled pen
Routes of administration	Subcutaneous use

Dosage and administration details:

BID at any time within the 60 minute period before the morning and evening meal. Byetta is a marketed product and the dose used was in accordance with labeling document.

Investigational medicinal product name	Exenatide extended-release
Investigational medicinal product code	
Other name	Bydureon®
Pharmaceutical forms	Solution for injection in pre-filled pen
Routes of administration	Subcutaneous use

Dosage and administration details:

QW at any time of day, independently of meals. Bydureon is a marketed product and the dose used was in accordance with labeling document.

Investigational medicinal product name	Albiglutide
Investigational medicinal product code	
Other name	Tanzeum®
Pharmaceutical forms	Solution for injection in pre-filled pen
Routes of administration	Subcutaneous use

Dosage and administration details:

QW at any time of day, independently of meals. Tanzeum is a marketed product and the dose used was in accordance with labeling document.

Investigational medicinal product name	Dulaglutide
Investigational medicinal product code	
Other name	Trulicity®
Pharmaceutical forms	Solution for injection in pre-filled pen
Routes of administration	Subcutaneous use

Dosage and administration details:

QW at any time of day, independently of meals. Trulicity is a marketed product and the dose used was in accordance with labeling document.

Number of subjects in period 1	Insulin Glargine/Lixisenatide Fixed Ratio Combination (FRC)	GLP-1 Receptor Agonist
Started	257	257
Treated	255	256
Completed	230	246
Not completed	27	11
Randomized but not treated	2	1
Adverse event	10	-
Withdrawal by Subject	9	9
Other than specified	3	1
Poor compliance to protocol	2	-
Lack of efficacy	1	-

Period 2

Period 2 title	Extension Period:26 Weeks(Upto 52 Weeks)
Is this the baseline period?	No
Allocation method	Randomised - controlled
Blinding used	Not blinded

Arms

Arm title	Insulin Glargine/Lixisenatide FRC- Single Arm Extension Period
------------------	--

Arm description:

Subjects who completed core treatment period and met eligibility criteria entered in extension treatment period and received same treatment (FRC injected subcutaneously QD on top of OAD therapy) for 26 weeks (up to Week 52). Dose individually adjusted.

Arm type	Experimental
Investigational medicinal product name	Insulin glargine/lixisenatide fixed-ratio combination
Investigational medicinal product code	HOE901/AVE0010
Other name	Soliqua
Pharmaceutical forms	Solution for injection in pre-filled pen
Routes of administration	Subcutaneous use

Dosage and administration details:

FRC was self-administered with a pre-filled disposable SoloStar® pen-injector. Dose of the combination was titrated according to the subject's need for insulin. FRC was given QD in the morning in the hour (0 to 60 minutes) before breakfast. Dose was individually titrated throughout the study to reach and maintain fasting SMPG: 80-100 mg/dL (4.4 - 5.6 mmol/L) avoiding hypoglycemia.

Number of subjects in period 2^[1]	Insulin Glargine/Lixisenatide FRC- Single Arm Extension Period
Started	206
Completed	197
Not completed	9
Adverse event	1
Other than specified	5
Poor compliance to protocol	3

Notes:

[1] - The number of subjects starting the period is not consistent with the number completing the preceding period. It is expected the number of subjects starting the subsequent period will be the same as the number completing the preceding period.

Justification: Out of 230 subjects, 206 subjects completed core period and met eligibility criteria for extension period.

Baseline characteristics

Reporting groups

Statistical analysis title	FRC vs. GLP-1 RA
----------------------------	------------------

Statistical analysis description:

HbA1c <7.0%: Insulin Glargine/Lixisenatide FRC vs GLP-1 Receptor Agonist. Analysis was performed using Cochran-Mantel-Haenszel method stratified on randomisation strata of Week -2 HbA1c (<8.0%, ≥8.0%), and randomisation strata of GLP-1 receptor agonist subtype at screening. Hierarchical testing procedure was used to control type I error and handle multiple secondary endpoint analyses. Testing was then performed sequentially per pre-specified order (only HbA1c < 7% was part of testing).

Secondary: Change From Baseline in 2-Hour Postprandial Plasma Glucose (PPG) During Standardized Meal Test to Week 52: Single Arm Extension Period

End point title	Change From Baseline in 2-Hour Postprandial Plasma Glucose (PPG) During Standardized Meal Test to Week 52: Single Arm Extension Period
End point description:	
The 2-hour PPG test measured blood glucose 2 hours after eating a liquid standardized breakfast meal. Change in PPG was calculated by subtracting baseline value from Week 52 value. Missing data was imputed using LOCF. Analysis was performed on mITT population who entered the extension period. Here, "number of subjects analysed"=subjects with baseline and at least one post-baseline plasma glucose assessment.

Statistical analyses

Statistical analysis title	FRC vs. GLP-1 RA
----------------------------	------------------

Statistical analysis description:

Analysis was performed using ANCOVA model with treatment groups, randomisation strata of Week -2 HbA1c (<8.0%, \geq 8.0%), randomisation strata of GLP-1 receptor agonist subtype (once/twice daily formulations, once weekly formulations) at screening, and world region as fixed effects and baseline 2-hour plasma glucose excursion value as a covariate. Testing according to the hierarchical testing procedure (continued only if previous endpoints were statistically significant).

Adverse events

Adverse events information

Timeframe for reporting adverse events:

All Adverse Events (AEs) were collected from signature of informed consent until the end of the study (up to 52 weeks).

Adverse event reporting additional description:

Reported AEs are treatment-emergent that is AEs that developed/worsened during the period from the administration of first dose of the study treatments up to 3 days (9 days for the weekly GLP1) after the last administration. Analysis was performed on safety population.

Assessment type	Systematic

Reporting groups

Reporting group title	Fixed Ratio Combination
-----------------------	-------------------------

Reporting group description:

FRC injected subcutaneously QD for 26 weeks on top of OAD therapy. Dose individually adjusted (median exposure: 183 days).

Reporting group title	GLP-1 Receptor Agonist
-----------------------	------------------------

Reporting group description:

GLP-1 Receptor Agonist GLP-1 RA receptor agonist (liraglutide QD, exenatide BID, exenatide extended-release QW, albiglutide QW, or dulaglutide QW) injected subcutaneously for 26 weeks on top of OAD therapy. GLP-1 RAs were administered as per local labeling at the same dose schedule as prior to randomization (median exposure: 183 days).

Reporting group title	Fixed Ratio Combination Whole Study period
-----------------------	--

Reporting group description:

Participants who completed core treatment period and met eligibility criteria entered in extension treatment period and received same treatment (FRC injected subcutaneously QD on top of OAD therapy) for 26 weeks (up to Week 52). Dose individually adjusted (median exposure: 365 days).

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
22 September 2016	Main changes were the following: - A single-arm FRC 26-week extension period was introduced to provide additional assessment of all safety, efficacy and other endpoints over 52 weeks in total. - Pharmacokinetic and antibody assessments were added in the FRC treatment group to gain information about exposure to lixisenatide and to assess the immunogenicity of insulin glargine and lixisenatide. - Minor clarifications and corrections were also made.
12 May 2017	Main change was to allow inclusion of subjects receiving background treatment of SGLT2 inhibitors. - Minor clarifications and corrections were also made.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
