

Clinical trial results:

A Phase 1b/2, Open Label, Randomized, Repeat-Dose, Dose-Escalation Study to Evaluate the Safety, Tolerability, Biological Activity, and Pharmacokinetics of ND-L02-s0201 Injection, a Vitamin A-Coupled Lipid Nanoparticle Containing siRNA Against HSP47, in Subjects with Moderate to Extensive Hepatic Fibrosis (METAVIR F3-4)

Summary

EudraCT number	2014-004882-26
Trial protocol	BG
Global end of trial date	10 May 2016

Notes:

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	10 May 2016
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	10 May 2016
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

Evaluate the safety and tolerability of once or twice a week ND-L02-s0201 Injection(ND-L02-s0201) administered as intravenous (IV) infusions for 5 consecutive weeks to subjects with moderate to extensive hepatic fibrosis (METAVIR fibrosis stage 3-4 [F3-4]).

Protection of trial subjects:

The study was in compliance with the ethical principles derived from the Declaration of Helsinki and in compliance with all International Conference on Harmonization Good Clinical Practice Guidelines. All the local regulatory requirements pertinent to safety of trial subjects were followed.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	01 October 2014
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Bulgaria: 5
Country: Number of subjects enrolled	United States: 20
Worldwide total number of subjects	25
EEA total number of subjects	5

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	21
From 65 to 84 years	4
85 years and over	0

Subject disposition

Recruitment

Recruitment details: -

Pre-assignment

Screening details:

A total of 25 subjects were enrolled, randomized to a treatment group, and received at least 1 dose of study drug.

Period 1

Period 1 title	Overall study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
Arm title	Cohort 1 (0.2 mg/kg/wk)

Arm description:

ND-L02-s0201 administered by IV infusion either once per week (once weekly) or administered in 2 divided doses per week (twice weekly) for 5 weeks

Arm type	Experimental
Investigational medicinal product name	ND-L02-s0201
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

ND-L02-s0201 0.2 mg/kg/week administered by IV infusion either once weekly or twice weekly in 2 divided doses

Arm title	Cohort 2 (0.4 mg/kg/wk)
------------------	-------------------------

Arm description:

ND-L02-s0201 administered by IV infusion either once per week (once weekly) or administered in 2 divided doses per week (twice weekly) for 5 weeks

Arm type	Experimental
Investigational medicinal product name	ND-L02-s0201
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

ND-L02-s0201 0.4 mg/kg/week administered by IV infusion either once weekly or twice weekly in 2 divided doses

Arm title	Cohort 3 (0.6 mg/kg/wk)
------------------	-------------------------

Arm description:

ND-L02-s0201 administered by IV infusion either once per week (once weekly) or administered in 2 divided doses per week (twice weekly) for 5 weeks

Statistical analyses

No statistical analyses for this end point

Secondary: METAVIR Fibrosis Score Change from Baseline at week 6

End point title	METAVIR Fibrosis Score Change from Baseline at week 6 ^[4]
-----------------	--

End point description:

Fibrosis stage and activity grade of liver biopsies were evaluated by a local pathologist using meta-analysis of histological data in viral hepatitis (METAVIR) fibrosis staging and activity grading. The number of subjects that achieved a change in METAVIR score at week 6 is reported for each arm for all subjects with scores available at Baseline and Week 6. A decrease in score represents an improvement in METAVIR fibrosis stage (METAVIR Fibrosis score: 0 = no fibrosis; 1 = portal fibrosis with rare septa; 3 = numerous septa without cirrhosis; 4 = cirrhosis)

End point type	Secondary

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
02 October 2014	<p>The timing of the final liver biopsy and corresponding serum HSP47 analysis was changed from Week 5 to Week 6. Screening evaluations were updated to include antibodies for hepatitis C virus (HCV) and human immunodeficiency virus (HIV), hepatitis B surface antigen (HBsAg), and to remove testing for hepatitis B virus (HBV) and HCV viral load. A urine drug screen was added to screening. The permitted concomitant treatments were updated to remove permission for stable, suppressive therapies for HBV and to include permission for a list of commonly administered medications. The prohibited concomitant treatments were updated to prohibit ongoing therapies for HBV and HCV, as well as treatment with interferon for any indication. The timing of weekly visits for subjects receiving infusions once per week or twice per week were made more stringent during Weeks 1 to 5 to ensure that treatments and assessments were made at appropriate intervals. The timing of weekly visits was relaxed for Week 7 to 24 to ± 2 days. The weight to be used for dose determination for all doses was corrected from weight taken at screening to weight taken at baseline. A statement indicating that instructions for treating immediate or delayed infusion-related reactions would be provided to the site was removed to allow the Investigator to treat such reactions as medically appropriate at their discretion. procedures/assessments to be completed in the event of early termination from the study were added. The number of subjects screened for the study and protocol deviations was to be included in the data that is reviewed by the Data Safety Monitoring Board (DSMB) before opening the next cohort. An inclusion criterion was added to allow enrollment of active substance abusers at the discretion of the Investigator. The exclusion criterion which excludes subjects with a history of malignancy within the last 5 years was modified to include an exception for basal cell carcinoma.</p>
18 November 2014	<p>Provided windows around the timing of blood draws for PK assessments. Provided windows for blood draws for complement determination during and after study drug infusion. Clarified the difference between prior and concomitant medications. Added definition of the METAVIR score system for severity of fibrosis. Included language that the METAVIR activity grading would be collected. Specified treatment days for the twice-weekly treatment regimen and provided treatment windows for treatment days; specified minimum time between infusions during study treatment weeks. Specified a visit window for the Week 6 evaluation and clarified that the window does not apply to the liver biopsy. Changed the requirement for the Week 6 visit to occur on Monday for those dosed twice weekly to occur 1 week after the last infusion. Changed the requirement for blood pressure to be taken from the same extremity each measurement to be taken from the opposite arm from the infusion arm. Allow screening labs to serve also as baseline labs if the screening visit was within 7 days of the baseline visit. Removed collection of samples for serum heat shock protein 47 (HSP47) assessment. Changed the section on pregnancy from gaining informed consent to gaining permission to follow a pregnancy through to outcome. Clarified that temperature is to be taken orally. Removed the exclusion criterion for subjects with carcinoembryonic antigen (CEA) levels above upper limit of normal.</p>
05 March 2015	<p>Visit schedule clarified for subjects who receive treatment once weekly. Text made consistent with Section 10.1 Dosing Schedule (ie, subjects randomly assigned to receive treatment once per week should be dosed the same day of the week throughout the treatment period). A breathalyzer was added as an option for ethanol screening at European sites in the event that urine ethanol testing is unavailable. The liver fibrosis scoring system was changed. METAVIR scoring was used to evaluate liver fibrosis. Knodell scoring and Ishak scoring were removed from the protocol. Weight and height discussion moved from physical examination section to vital signs/weight/height section. The requirement to conduct a baseline physical exam and a baseline electrocardiogram (ECG) was removed if these procedures were conducted at screening within 7 days before the baseline visit.</p>

26 August 2015	<p>Study days were corrected for Weeks 12, 16, 20, and 24: Week 12 (Day 78 ± 2 days) Week 16 (Day 106 ± 2 days) Week 20 (Day 134 ± 2 days) Week 24 (Day 162 ± 2 days) Additional timepoint was added at Week 12 (Visit 11, ± 2 days). Additional blood samples were added for liver fibrosis marker, Mac-2 binding protein glycosylation isomer (M2BPGi) before the first treatment (Week 1), after the end of infusion (EOI) of the last treatment (Week 5), and during follow-up at the Week 12 and at Week 24 visits (or at early termination). Results were added for long-term pharmacology and toxicology studies conducted with ND-L02-s0201. Modified the language to allow flexibility for the total number of enrolled subjects, to accommodate the potential of replacement subjects, and clarified that subjects who withdraw from the study during the dosing phase may have been replaced and described the procedures for their replacement. Wording revised to indicate that any potential disturbance in bone density was monitored in human subjects by dual-energy X-ray absorptiometry (DEXA) scans. Description of results from the Phase 1a Study ND-L02-s0201-001 was expanded to indicate there was no evidence of drug-related effects on biomarkers of bone turnover. Justification was expanded to include nonclinical study results. Introduced a window of ± 15 minutes to the 2 hours before the start of study drug infusion at which the premedication oral dose of levocetirizine dihydrochloride could be administered. The liver fibrosis scoring system was changed. Ishak and Knodell scoring were used in addition to METAVIR scoring to evaluate liver fibrosis. An evaluation of the analysis of the biopsy samples using quantitative reverse transcription polymerase chain reaction (qRT-PCR) and histology staining was done throughout the study. Slides for all subjects in all cohorts were stained for Sirius Red staining throughout the study not just those in Cohort 3.</p>
