

Clinical trial results:

A phase II study of the use of azacitidine for the treatment of patients with chronic graft-versus-host-disease who have failed therapy with corticosteroids

Summary

EudraCT number	2014-005659-19
Trial protocol	GB
Global end of trial date	18 August 2020

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	18 November 2020
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	18 August 2020
Was the trial ended prematurely?	Yes

Notes:

General information about the trial

Main objective of the trial:

To investigate the safety and activity (in terms of best overall response within 6 months) of azacitidine in the treatment of patients with cGVHD who have failed therapy with corticosteroids

Protection of trial subjects:

Azacitidine is licensed for use in intermediate-2 and high-risk myelodysplastic syndromes (MDS) according to the International Prognostic Scoring System (IPSS), chronic myelomonocytic leukaemia (CMML) with 10-29 % marrow blasts without myeloproliferative disorder and acute myeloid leukaemia (AML) with 20-30% blasts and multi-lineage dysplasia, according to World Health Organisation (WHO) classification. Azacitidine has been used following allogeneic stem cell transplantation (ASCT) in clinical trials as maintenance therapy. To our knowledge, it has not been used to treat patients with cGVHD. The dose of azacitidine planned in the AZTEC trial is the same as the dose stipulated in published data of patients who have received a ASCT (i.e. roughly half the dose used in standard practice - 36mg/m² rather than 75mg/m²

given over 5 days rather than 7 days). In standard practice azacitidine is injected subcutaneously, whereas in this trial it can be administered either by subcutaneous injections or via intravenous infusion (IV). The option of the IV route is because subcutaneous injection often causes a reaction at the injection site. As there is a strong likelihood that some of this patient population will have severe skin complications; it is considered safer to administer the azacitidine intravenously to these patients. The safety profile of azacitidine is well understood and all participating sites will be familiar with expected adverse reactions (ARs) and their management.

Detailed information was described in the protocol to decrease the incidence of any and relieve the symptoms of possible unwanted events.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	05 October 2015
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	United Kingdom: 14
Worldwide total number of subjects	14
EEA total number of subjects	14

Notes:

Subjects enrolled per age group

In utero	0
----------	---

Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	12
From 65 to 84 years	2
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

Fifteen patients were registered to the trial, of which, 14 patients are evaluable and data for 14 patients will be presented. A single patient was found to be ineligible post randomisation and therefore was withdrawn from the trial.

Pre-assignment

Screening details:

Screening commenced following consent and prior to patient registration in order to confirm eligibility. The Investigator will conduct a full screening evaluation to ensure that the patient satisfies all inclusion and exclusion criteria. Detailed screening formation was described in the protocol.

Period 1

Period 1 title	Overall Trial (overall period)
Is this the baseline period?	Yes
Allocation method	Not applicable
Blinding used	Not blinded

Arms

Arm title	Registered patients
-----------	---------------------

Arm description:

Patients will receive treatment with 36mg/m² of azacitidine of days 1-5 of each cycle. Each cycle will last 28 days. Azacitidine may be administered via subcutaneous injection or intravenously to avoid potential complications of administering subcutaneously if the patient has extensive skin cGvHD. If a patient starts treatment with azacitidine being administered intravenously but subsequently can tolerate subcutaneous injection then the method of administration can be changed. This also applies if the patient starts on subcutaneous injection but can no longer tolerate this, the administration can be changed to intravenous. Patients will receive 6 cycles of azacitidine treatment. Patients may continue beyond 6 cycles (maximum of 10) if clinical benefit is observed.

Arm type	Experimental
Investigational medicinal product name	Azacitidine
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Powder for suspension for injection
Routes of administration	Intravenous use, Subcutaneous use

Dosage and administration details:

Patients will receive treatment with 36mg/m² of azacitidine of days 1-5 of each cycle. Each cycle will last 28 days. Azacitidine may be administered via subcutaneous injection or intravenously to avoid potential complications of administering subcutaneously if the patient has extensive skin cGvHD. The dose of azacitidine to be administered should be calculated based upon the patient's body surface area (BSA).

Method of subcutaneous injection:

Reconstituted azacitidine should be injected subcutaneously into the upper arm, thigh or abdomen. Injection sites should be rotated. New injections should be given at least 2.5 cm from the previous site and never into areas where the site is tender, bruised, red or hardened.

Method of infusion:

The total dose of azacitidine should be administered over a period of 10-40 minutes. Please note the administration must be completed within 1 hour of reconstitution.

Adverse events

Adverse events information

Timeframe for reporting adverse events:

Details of all AEs (except those listed above) were to be documented and reported from the date of commencement of protocol defined treatment until 28 days after the administration of the last treatment.

Adverse event reporting additional description:

SAEs that were at least possibly related to azacitidine were reported in an expedited manner irrespective of how long after IMP administration the reaction occurred.

Neuralgia subjects affected / exposed occurrences (all)	1 / 14 (7.14%) 1		
Tremor subjects affected / exposed occurrences (all)	1 / 14 (7.14%) 1		
Eye disorders Retinal vascular disorder subjects affected / exposed occurrences (all)	1 / 14 (7.14%) 1		
Gastrointestinal disorders Diarrhea subjects affected / exposed occurrences (all)	1 / 14 (7.14%) 1		

Gastroesophageal reflux disease subjects affected / exposed occurrences (all)	1 / 14 (7.14%) 1		
Nausea subjects affected / exposed occurrences (all)	1 / 14 (7.14%) 1		
Vomiting subjects affected / exposed occurrences (all)	1 / 14 (7.14%) 1		
Skin and subcutaneous tissue disorders			
Dry skin subjects affected / exposed occurrences (all)	1 / 14 (7.14%) 1		
Pain of skin subjects affected / exposed occurrences (all)	1 / 14 (7.14%) 3		
Pruritus subjects affected / exposed occurrences (all)	1 / 14 (7.14%) 1		
Rash maculo-papular subjects affected / exposed occurrences (all)	1 / 14 (7.14%) 1		
Skin and subcutaneous tissue disorder subjects affected / exposed occurrences (all)	2 / 14 (14.29%) 2		
Renal and urinary disorders			
Acute kidney injury subjects affected / exposed occurrences (all)	1 / 14 (7.14%) 1		
Chronic kidney disease subjects affected / exposed occurrences (all)	1 / 14 (7.14%) 2		
Musculoskeletal and connective tissue disorders			
Flank pain subjects affected / exposed occurrences (all)	1 / 14 (7.14%) 1		

Musculoskeletal and connective tissue disorder subjects affected / exposed occurrences (all)	1 / 14 (7.14%) 3		
Infections and infestations Bladder infection subjects affected / exposed occurrences (all) Lung infection subjects affected / exposed occurrences (all) Sepsis subjects affected / exposed occurrences (all) Sinusitis subjects affected / exposed occurrences (all)	1 / 14 (7.14%) 1 1 / 14 (7.14%) 1 1 / 14 (7.14%) 1 1 / 14 (7.14%) 1		
Metabolism and nutrition disorders Hyperglycemia subjects affected / exposed occurrences (all) Hypocalcemia subjects affected / exposed occurrences (all) Hypokalemia subjects affected / exposed occurrences (all)	1 / 14 (7.14%) 1 1 / 14 (7.14%) 1 2 / 14 (14.29%) 3		

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
01 December 2016	Change to the time point the first research sample is taken. Change to the route of administration of azacitidine from remaining consistent per patient throughout the trial to allowing the route to be changed during treatment. Update to NIH chronic GvHD assessment for Clinician use Update to lung function tests
11 July 2017	Clarification of permitted delays to treatment. Change to the lung function tests. Change to the units used to measure Liver total bilirubin in the NIH chronic GvHD assessment form. Clarification of statistical analysis of primary and secondary outcome measures, population for analysis and interim and final analysis, Addition of units for the baseline only values in the NIH chronic GvHD assessment form v3.0 17-Jan-2018.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
