

## Clinical trial results:

### **SENSCIS®: A double-blind, randomised, placebo-controlled trial evaluating efficacy and safety of oral nintedanib treatment for at least 52 weeks in patients with 'Systemic Sclerosis-associated Interstitial Lung Disease' (SSc-ILD)**

#### **Summary**

EudraCT number	2015-000392-28
Trial protocol	NL DE GB PT DK BE ES GR FR PL IE FI NO SE AT HU CZ IT
Global end of trial date	28 November 2018

#### **Results information**

Result version number	v2 (current)
This version publication date	14 November 2021
First version publication date	13 November 2019
Version creation reason	

#### **Trial information**

##### **Trial identification**

Sponsor protocol code	1199.214
-----------------------	----------

##### **Additional study identifiers**

ISRCTN number	-
ClinicalTrials.gov id (NCT number)	NCT02597933
WHO universal trial number (UTN)	-

Notes:

Notes:

#### **Paediatric regulatory details**

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

## Results analysis stage

Analysis stage	Final
Date of interim/final analysis	19 December 2018
Is this the analysis of the primary completion data?	Yes
Primary completion date	31 October 2018
Global end of trial reached?	Yes
Global end of trial date	28 November 2018
Was the trial ended prematurely?	No

Notes:

## General information about the trial

Main objective of the trial:

To investigate the efficacy and safety of nintedanib 150 mg twice daily (bid) in patients with SSc-ILD

Protection of trial subjects:

Only subjects that met all the study inclusion and none of the exclusion criteria were entered in the study. All subjects were free to withdraw from the clinical trial at any time for any reason given. Close monitoring of all subjects was adhered to throughout the trial conduct

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	30 November 2015
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

## Population of trial subjects

### Subjects enrolled per country

Country: Number of subjects enrolled	Argentina: 7
Country: Number of subjects enrolled	Australia: 13
Country: Number of subjects enrolled	Austria: 2
Country: Number of subjects enrolled	Belgium: 23
Country: Number of subjects enrolled	Brazil: 7
Country: Number of subjects enrolled	Canada: 6
Country: Number of subjects enrolled	Chile: 8
Country: Number of subjects enrolled	China: 39
Country: Number of subjects enrolled	Czechia: 5
Country: Number of subjects enrolled	Denmark: 15
Country: Number of subjects enrolled	Finland: 5
Country: Number of subjects enrolled	France: 73
Country: Number of subjects enrolled	Germany: 63
Country: Number of subjects enrolled	Greece: 18
Country: Number of subjects enrolled	Hungary: 2
Country: Number of subjects enrolled	India: 54
Country: Number of subjects enrolled	Ireland: 2
Country: Number of subjects enrolled	Israel: 15
Country: Number of subjects enrolled	Italy: 41
Country: Number of subjects enrolled	Japan: 92
Country: Number of subjects enrolled	Malaysia: 8

Country: Number of subjects enrolled	Mexico: 2
Country: Number of subjects enrolled	Netherlands: 22
Country: Number of subjects enrolled	Norway: 5
Country: Number of subjects enrolled	Poland: 33
Country: Number of subjects enrolled	Portugal: 17
Country: Number of subjects enrolled	Spain: 27
Country: Number of subjects enrolled	Sweden: 2
Country: Number of subjects enrolled	Switzerland: 5
Country: Number of subjects enrolled	Thailand: 9
Country: Number of subjects enrolled	United Kingdom: 18
Country: Number of subjects enrolled	United States: 181
Worldwide total number of subjects	819
EEA total number of subjects	355

Notes:

---

### Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	641
From 65 to 84 years	178
85 years and over	0

## Subject disposition

### Recruitment

Recruitment details:

This was a randomised, placebo-controlled, double-blind, parallel design trial.

Abbreviation used:

treatment (trt)

baseline (bl.)

categorical (cat.)

continuous (cont.)

number (no.)

patient (pt)

Placebo (pl.)

discontinued (disc.)

primary analysis (PA)

### Pre-assignment

Screening details:

All subjects were screened for eligibility to participate in trial. Subjects attended specialist sites to ensure that they (the subjects) met all implemented inclusion/exclusion criteria. Subjects were not to be randomised to trial drug if any of the specific entry criteria was violated

### Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Monitor, Data analyst

Blinding implementation details:

This was a randomised, placebo-controlled, double-blind, parallel design trial.

### Arms

Are arms mutually exclusive?	Yes
<b>Arm title</b>	Placebo

Arm description:

Patients were administered orally placebo matching nintedanib 150 milligram (mg) soft gelatine capsules, twice daily with a possibility to interrupt treatment or to reduce to 100mg to manage adverse events.

Two subjects randomised to matching placebo were not treated. Although the actual number of randomised patients is 290, as two subjects were not treated, the number of patients that provided data for analyses (shown in "Started" column) is 288. To be consistent with the baseline section the number of subjects treated is shown as started.

Arm type	Placebo
Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Capsule, soft
Routes of administration	Oral use

Dosage and administration details:

Patients were administered orally placebo matching nintedanib 150 milligram (mg) soft gelatine capsules, twice daily with a possibility to interrupt treatment or to reduce to 100mg to manage adverse events.

<b>Arm title</b>	Nintedanib
------------------	------------

Arm description:

Patients were administered orally 150 milligram (mg) soft gelatin capsules, twice daily with a possibility to interrupt treatment or to reduce to 100mg to manage adverse events.

Two subjects randomised to Nintedanib were not treated. Although the actual number of randomised patients is 290, as two subjects were not treated, the number of patients that provided data for analyses (shown in "Started" column) is 288. To be consistent with the baseline section the number of subjects treated is shown as started.

Arm type	Experimental
Investigational medicinal product name	Nintedanib
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Capsule, soft
Routes of administration	Oral use

Dosage and administration details:

Patients were administered orally 150 milligram (mg) soft gelatin capsules, twice daily with a possibility to interrupt treatment or to reduce to 100mg to manage adverse events.

<b>Number of subjects in period 1<sup>[1]</sup></b>	Placebo	Nintedanib
Started	288	288
Completed	252	239
Not completed	36	49
Consent withdrawn by subject	7	5
Adverse event, non-fatal	20	28
Protocol deviation	2	2
Other than stated above	7	14

Notes:

[1] - The number of subjects reported to be in the baseline period are not the same as the worldwide number enrolled in the trial. It is expected that these numbers will be the same.

Justification: Baseline characteristics are based on patients who were randomised after successfully completing the screening period and received at least one dose of the trial medication.

## Baseline characteristics

### Statistical analyses

Statistical analysis title	Statistical Analysis I
----------------------------	------------------------

Statistical analysis description:

The primary analysis is a restricted maximum likelihood (REML) based approach using a random slope & intercept model. The analysis included the fixed, categorical effects of treatment, ATA status & gender, fixed continuous effects of time & baseline FVC (mL), age and height as well as the treatment-by time & baseline-by-time interactions. Random effects was included for patient response for both time & intercept. Within-patient errors are modelled by an unstructured variance-covariance matrix

Comparison groups	Placebo v Nintedanib
Number of subjects included in analysis	576
Analysis specification	Pre-specified
Analysis type	other <sup>[3]</sup>
P-value	= 0.035
Method	random coefficient regression
Parameter estimate	Mean difference (final values)
Point estimate	40.95
Confidence interval	
level	95 %
sides	2-sided
lower limit	2.88
upper limit	79.01
Variability estimate	Standard error of the mean
Dispersion value	19.38

Notes:

[3] - The model assumed that data were missing at random & that patients who dropped out would have behaved similarly to those who remained in trial.

<b>Statistical analysis title</b>	Statistical Analysis II
-----------------------------------	-------------------------

Statistical analysis description:

This is a sensitivity analysis (SA) on primary endpoint including only on-trt measurements of FVC [mL]. The random coefficient model was used. The analysis included fixed, categorical effects of trt, ATA status & gender, fixed continuous effects of time & bl. FVC (mL), age, height, trt -by time & bl.-by-time interactions. Random effects included for patient response for both time & intercept. Within-patient errors were modelled by an Unstructured variance-covariance matrix.

Comparison groups	Placebo v Nintedanib
Number of subjects included in analysis	576
Analysis specification	Pre-specified
Analysis type	other <sup>[4]</sup>
P-value	= 0.0378
Method	random coefficient regression
Parameter estimate	Mean difference (final values)
Point estimate	43.13
Confidence interval	
level	95 %
sides	2-sided
lower limit	2.44
upper limit	83.83

Notes:

[4] - The model assumed that data were missing at random & that patients who dropped out would have behaved similarly to those who remained in trial.

<b>Statistical analysis title</b>	Statistical Analysis III
-----------------------------------	--------------------------

Statistical analysis description:

In multiple imputation SA 1, missing FVC values at wk 52 in pts who were alive at wk 52 were imputed assuming similar rate of FVC decline as in pts from corresponding trt group who prematurely disc. trial drug but had wk 52 FVC value. Missing FVC values at wk 52 in pts who died before wk 52 were imputed assuming similar rate of FVC decline as in pl. pts with wk 52 FVC value who prematurely disc. trial drug with most severe declines. The imputation model was similar to statistical model of PA.

Comparison groups	Placebo v Nintedanib
-------------------	----------------------

Number of subjects included in analysis	576
Analysis specification	Pre-specified
Analysis type	other
P-value	= 0.1046
Method	random coefficient regression
Parameter estimate	Mean difference (final values)
Point estimate	30
Confidence interval

Point estimate	40.98

Confidence interval	
level	95 %
sides	2-sided
lower limit	2.92
upper limit	79.04

## Secondary: Absolute change from baseline in the Modified Rodnan Skin Score (mRSS) at Week 52

End point title	Absolute change from baseline in the Modified Rodnan Skin Score (mRSS) at Week 52
-----------------	---

### End point description:

This is the first key secondary endpoint. The modified Rodnan Skin Score (mRSS) is an evaluation of the patient's skin thickness rated by clinical palpation using a 0 to 3 scale. The scale differentiates between 0 = normal skin, 1 = mild thickness, 2 = moderate thickness, and 3 = severe thickness with inability to pinch the skin into a fold. The palpation is done for each of the 17 surface anatomic areas of the body: face, anterior chest, abdomen, fingers (right and left separately), forearms, upper arms, thighs, lower legs, dorsum of hands and feet. The sum of these individual values is defined as the total skin score. The mRSS has a range from 0 (no thickening) to 51 (severe thickening in all 17 areas). A high score corresponds to worse skin thickness. Least square mean is actually the adjusted mean. Adjusted mean was based on all analysed patients in the model (not only patients with a baseline and measurement at Week 52).

End point type	Secondary
----------------	-----------

### End point timeframe:

Baseline and up to 52 weeks after the start of administration

## Statistical analyses

Statistical analysis title	Statistical Analysis I
----------------------------	------------------------

### Statistical analysis description:

The mixed model repeated measures (MMRM) approach was used. The model assumed that data were missing at random & that patients who dropped out would have behaved similarly to those who remained in trial.

Comparison groups	Placebo v Nintedanib
Number of subjects included in analysis	576
Analysis specification	Pre-specified
Analysis type	other
P-value	= 0.5785
Method	MMRM
Parameter estimate	Mean difference (final values)
Point estimate	-0.21

Confidence interval	
level	95 %
sides	2-sided
lower limit	-0.94
upper limit	0.53
Variability estimate	Standard error of the mean
Dispersion value	0.37

## Secondary: Absolute change from baseline in Saint George's Respiratory Questionnaire (SGRQ) total score at Week 52.

End point title	Absolute change from baseline in Saint George's Respiratory Questionnaire (SGRQ) total score at Week 52.
-----------------	--

### End point description:

This is the second key secondary endpoint. The Saint George's Respiratory Questionnaire measures the health status in patients with chronic airflow limitation. It consists of 2 parts that cover 3 domains: symptoms, activities, and impacts. The symptom domain relates to the effect, frequency and severity of respiratory symptoms. The activity domain relates to activities that cause or are limited by breathlessness. The impact domain evaluates a range of aspects concerned with social functioning and psychological disturbances resulting from airways disease. The scores of these domains range from 0 (no impairment) to 100 (worst possible). The calculated total score summarises the impact of the disease on overall health status. A high score corresponds to worse health. Least square mean is actually the adjusted mean. Adjusted mean was based on all analysed patients in the model (not only patients with a baseline and measurement at Week 52).

End point type	Secondary
----------------	-----------

### End point timeframe:

Baseline and up to 52 weeks after the start of administration

Statistical analysis title	Statistical Analysis I
Statistical analysis description:	The mixed model repeated measures (MMRM) approach was used, with fixed categorical effects of ATA status, visit, treatment-by-visit interaction and baseline-by-visit interaction. Visit was the repeated measure. Within-patient errors were modelled by unstructured variance-covariance structure.
Comparison groups	Placebo v Nintedanib

Number of subjects included in analysis	576
Analysis specification	Pre-specified
Analysis type	other <sup>[18]</sup>
P-value	= 0.4547
Method	MMRM
Parameter estimate	Mean difference (final values)
Point estimate	-6.28
Confidence interval	
level	95 %
sides	2-sided
lower limit	-22.77
upper limit	10.21
Variability estimate	Standard error of the mean
Dispersion value	8.39

Notes:

[18] - The model assumed that data were missing at random & that patients who dropped out would have behaved similarly to those who remained in trial.

## Secondary: Time to death

End point title	Time to death
End point description:	
Length of survival of patients treated with a placebo or Nintedanib 150 mg bid over the whole trial. The number of patients who observed an event are summarized below.	
End point type	Secondary
End point timeframe:	
From date of first trial drug intake up to date of death or last contact date (ie., up to 100 weeks)	

End point values	Placebo	Nintedanib		
Subject group type	Reporting group	Reporting group		
Number of subjects analysed	288 <sup>[19]</sup>	288 <sup>[20]</sup>		
Units: Participants				
number (not applicable)	9	10

## Statistical analyses

Statistical analysis title	Statistical Analysis I
Statistical analysis description:	
Based on Cox's regression model (Wald test), stratified by ATA status.	
Comparison groups	Placebo v Nintedanib
Number of subjects included in analysis	576
Analysis specification	Pre-specified
Analysis type	other
P-value	= 0.7535
Method	Regression, Cox
Parameter estimate	Hazard ratio (HR)
Point estimate	1.16

Confidence interval	
level	95 %
sides	2-sided
lower limit	0.47
upper limit	2.84

## Secondary: The percentage (%) of responder based on Combined Response Index in Systemic Sclerosis (CRISS) at Week 52

End point title	The percentage (%) of responder based on Combined Response Index in Systemic Sclerosis (CRISS) at Week 52
-----------------	---

End point description:

The percentage (%) of responder based on Combined Response Index in Systemic Sclerosis (CRISS) at Week 52. This is a composite endpoint, based on the mRSS, FVC percent predicted, HAQ-DI, patient's global impression of overall health VAS and physician's global impression of patient's overall health VAS, as well as the absence of significant worsening of interstitial lung disease, a new scleroderma renal crisis, left ventricular failure or pulmonary arterial hypertension. The CRISS index score represents a probability of improvement and ranges between 0 and 1. This is a 2 stage process to predict probability of improvement: Step 1 – absence of major organ progression (SRC etc.) – score "0" Step 2 – predicted probability of improvement – (score "0 – 1").

End point type	Secondary
----------------	-----------

End point timeframe:

Week 52

End point values	Placebo	Nintedanib		
Subject group type	Reporting group	Reporting group		
Number of subjects analysed	288 <sup>[21]</sup>	288 <sup>[22]</sup>		
Units: (%) of responder based on CRISS				
number (not applicable)	11.8	12.2

## Statistical analyses

Statistical analysis title	Statistical Analysis I
----------------------------	------------------------

Statistical analysis description:

The comparison between both treatment groups was performed using a Cochran-Mantel-Haenszel test. CRISS score at Week 52 was transformed into 100 binary responder endpoints using multiple imputation. These were analyzed using a Cochran-Mantel-Haenszel test, stratified by ATA status. OR and the 95% CI as obtained from all 100 imputations were combined using Rubin's rule.

Comparison groups	Placebo v Nintedanib
Number of subjects included in analysis	576
Analysis specification	Pre-specified
Analysis type	other
P-value	= 0.9115
Method	Cochran-Mantel-Haenszel
Parameter estimate	Odds ratio (OR)
Point estimate	1.03

Confidence interval	
level	95 %
sides	2-sided
lower limit	0.57
upper limit	1.88

## Secondary: Absolute change from baseline in Carbon Monoxide Diffusion Capacity (DLco) in % predicted at Week 52

End point title	Absolute change from baseline in Carbon Monoxide Diffusion Capacity (DLco) in % predicted at Week 52
End point description:	
Absolute change from baseline in Carbon Monoxide Diffusion Capacity (DLco) in % predicted at Week 52. Least square mean is actually the adjusted mean. Adjusted mean is based on all analysed patients in the model (not only patients with a baseline and measurement at week 52).	
End point type	Secondary
End point timeframe:	
Baseline and up to 52 weeks after the start of administration	

End point values	Placebo	Nintedanib		
Subject group type	Reporting group	Reporting group		
Number of subjects analysed	288 <sup>[23]</sup>	288 <sup>[24]</sup>		
Units: % predicted DLco				
least squares mean (standard error)	-2.77 (± 0.54)	-3.21 (± 0.54)

lower limit	-1.94
upper limit	1.06

Variability estimate	Standard error of the mean
Dispersion value	0.76

## Secondary: Absolute change from baseline in digital ulcer net burden at Week 52

End point title	Absolute change from baseline in digital ulcer net burden at Week 52
-----------------	--

End point description:

Absolute change from baseline in digital ulcer net burden (defined as the number of new digital ulcers (DUs) plus the number of DUs that have been verified at any earlier assessment during the trial) at Week 52. It is calculated at a visit by counting the total number of fingertips with ulcers (i.e. number of fingers with presence of digital ulcer ticked "Yes") at the corresponding visit Least square mean is actually the adjusted mean. Adjusted mean is based on all analysed patients in the model (not only patients with a baseline and measurement at week 52).

End point type	Secondary
----------------	-----------

End point timeframe:

Baseline and up to 52 weeks after the start of administration

End point values	Placebo	Nintedanib

## Secondary: Absolute change from baseline in Health Assessment Questionnaire-Disability Index (HAQ-DI) score at Week 52

End point title	Absolute change from baseline in Health Assessment Questionnaire-Disability Index (HAQ-DI) score at Week 52
-----------------	---

### End point description:

Absolute change from baseline in Health Assessment Questionnaire-Disability Index (HAQ-DI) score at Week 52. The HAQ-DI score is calculated as follows: Each question is scored 0–3 (where 0= “without difficulty” & 3= “unable to do”). There are 8 categories (Dressing & Grooming, Arising, Eating, Walking, Hygiene, Reach, Grip, Activities), each including 2 or 3 questions. The score for each category corresponds to maximum question score within each category. Finally, HAQ-DI score corresponds to sum of the sub-scores of all 8 categories divided by number of categories completed. Please note that if there are fewer than 6 categories with responses, then a score cannot be calculated. The HAQ-DI score scale has 25 possible values (i.e., 0, 0.125, 0.250, 0.375 ... 3). A high score corresponds to worse impairment. Least square mean is actually the adjusted mean. Adjusted mean is based on all analysed patients in the model (not only patients with a baseline and measurement at week 52).

End point type	Secondary
----------------	-----------

### End point timeframe:

## Adverse events

### Adverse events information

Timeframe for reporting adverse events:

From date of first trial drug intake up to date of death or last contact date (ie., up to 100 weeks).

Assessment type	Systematic
-----------------	------------

### Dictionary used

Dictionary name	MedDRA
-----------------	--------

Dictionary version	21.1
--------------------	------

### Reporting groups

Reporting group title	Placebo
-----------------------	---------

Reporting group description:

Patients were administered orally placebo matching nintedanib 150 milligram (mg) soft gelatine capsules, twice daily with a possibility to interrupt treatment or to reduce to 100mg to manage adverse events. Two subjects randomised to matching placebo were not treated. Although the actual number of randomised patients is 290, as two subjects were not treated, the number of patients that provided data for analyses (shown in "Started" column) is 288. To be consistent with the baseline section the number of subjects treated is shown as started.

Reporting group title	Nintedanib
-----------------------	------------

Reporting group description:

Patients were administered orally 150 milligram (mg) soft gelatin capsules, twice daily with a possibility to interrupt treatment or to reduce to 100mg to manage adverse events. Two subjects randomised to Nintedanib were not treated. Although the actual number of randomised patients is 290, as two subjects were not treated, the number of patients that provided data for analyses (shown in "Started" column) is 288. To be consistent with the baseline section the number of subjects treated is shown as started.

## More information

### Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
02 March 2016	<p>The following main changes in the conduct of the trial were introduced by the amendment:</p> <ol style="list-style-type: none"> <li>1) To ensure regular pregnancy testing as requested by health authorities, information was added that women of childbearing potential had to perform a pregnancy test every 4 to 6 weeks. Once intervals between site visits were &gt;6 weeks, home urine dipstick pregnancy tests were centrally provided and had to be performed at home.</li> <li>2) For Inclusion Criterion No. 5, the reference time point for the historical HRCT, which had to be performed within 12 months, was changed from Visit 2 to Visit 1, as Visit 1 represented the better predictable time point</li> <li>3) Exclusion Criterion No. 8 was updated to clarify that not only digital ulcers but also severe other ulcers could have led to the exclusion of a patient at the discretion of the investigator</li> <li>4) Exclusion Criterion No. 12 was updated to clarify that also severe gastrointestinal symptoms due to SSc could have led to the exclusion of a patient</li> <li>5) Exclusion Criterion No. 25 was added based on advice from regulatory agencies: patients with underlying chronic liver disease (Child Pugh A, B, C hepatic impairment)</li> <li>6) The restrictions regarding concomitant treatment with corticosteroids were modified.</li> <li>7) Patients on low dose corticosteroid therapy were eligible for the trial even if the dose of the corticosteroid medication was not stable</li> <li>8) The description of the method of measuring DLco was harmonised within the CTP, by removal of the adjustments for altitude and carboxyhaemoglobin incorrectly mentioned in one section of the CTP</li> <li>9) Addition of mycophenolate sodium to clarify that for 'mycophenolate' 2 possible salt forms are available.</li> </ol>
26 January 2017	<ol style="list-style-type: none"> <li>1) For selection of trial population, it was added that recruitment of pts who were on stable dose of mycophenolate or methotrexate background medications could have been restricted, although enrolment was generally competitive</li> <li>2) Numbers of sites &amp; countries contributing pts worldwide were updated from approximately 170 sites to about 230 sites &amp; from about 20 to 33 countries</li> <li>3) Inclusion Criterion No. 4 was revised &amp; requested SSc disease onset (defined by first non-Raynaud symptom) had to occur within 7 years instead of 5 years of Visit 1. This change was introduced to facilitate recruitment into trial, without compromising characterisation of trial population.</li> <li>4) For Exclusion Criterion No. 4, reference time point to assess eligibility regarding airway obstruction (pre-bronchodilator FEV1/FVC &lt;0.7) was changed from Visit 1 to Visit 2 to ensure consistency with all other lung function criteria</li> <li>5) To Exclusion Criterion No. 18 &amp; restrictions of concomitant trt required washout period of at least 8 weeks before Visit 2 was added for mycophenolate mofetil/sodium or methotrexate</li> <li>6) In Exclusion Criterion No. 22 tubal occlusion was removed as an example for method of permanent sterilization, since according to Clinical Trial Facilitation Group recommendations (2014), woman who underwent tubal ligation is still to be considered 'of childbearing potential'</li> <li>7) Exclusion Criterion No. 26 was added: pts with history of SSc renal crisis</li> <li>8) For AE collection &amp; reporting it was clarified that independent adjudication committee reviewed all fatal cases for primary causes of death. Data protection measures for committee &amp; adjudication process were clarified too.</li> <li>9) Absolute change from bl. at wk 52 in CRIS index score was added as secondary endpoint &amp; removed from list of further endpoints; however, TSAP defined to analyse proportion of responders instead of absolute change from bl.</li> <li>10) ATA status &amp; bl. FVC% predicted were included as covariates in analysis of rate of decline in FVC in % predicted.</li> </ol>

15 February 2018	<p>The following main changes in the conduct of the trial were introduced by the amendment:</p> <ol style="list-style-type: none"> <li>1) The end of trial for patients on-treatment as well as for patients who prematurely discontinued trial medication and attended visits as planned was clarified. Details regarding the time point of the EOT Visit and requirements for Follow-up Visits were added.</li> <li>2) The restrictions regarding concomitant treatment were modified. The definition of clinically significant deterioration was extended to other clinical parameters than mRSS and FVC</li> <li>3) Clarification that based on the half-life of the trial drug, a safety analysis restricted to AEs that occurred between the start of treatment and up to 7 days after the date of the last dose of trial medication were analysed in addition</li> </ol>
------------------	---

Notes:
