

Clinical trial results:

Tight control dose reductions of biologics in psoriasis patients with low disease activity: a randomized pragmatic trial.

Summary

EudraCT number	2015-000943-17
Trial protocol	NL
Global end of trial date	01 August 2019

Notes:

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	22 July 2018
Is this the analysis of the primary completion data?	Yes
Primary completion date	22 July 2018
Global end of trial reached?	Yes
Global end of trial date	01 August 2019
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

We aim to investigate whether we could taper the biologics dose in psoriasis patients with stable disease-activity and good quality of life. The primary research question for this proposal is: Is a biologics dose tapering strategy non-inferior to usual care with respect to disease activity?

Protection of trial subjects:

All patients who are eligible for this study will be asked by their dermatologist and they will receive oral and written information from the local investigator. The investigator will obtain written informed consent and the patient will be randomized. The schedule of their biological will be explained depending on which biologic the patient uses.

Subjects can leave the study at any time for any reason if they wish to do so without any consequences. The investigator can decide to withdraw a subject from the study for urgent medical reasons. When subjects are withdrawn from the study, they will not be replaced.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	08 January 2016
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Netherlands: 120
Worldwide total number of subjects	120
EEA total number of subjects	120

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0

Adults (18-64 years)	86
From 65 to 84 years	34
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

All patients who are eligible for this study will be asked by their dermatologist and they will receive oral and written information from the local investigator. The investigator will obtain written informed consent and the patient will be randomized.

Pre-assignment

Screening details:

Patients 18 years or older with plaque psoriasis and stable low disease activity using standard doses of adalimumab, etanercept, or ustekinumab for at least 6 months were included. Low disease activity is described as a PASI score of 5 or lower at 2 subsequent visits in the past 6 months and a DLQI score of 5 or lower at study inclusion.

Pre-assignment period milestones

Number of subjects started	120
Number of subjects completed	120

Period 1

Period 1 title	Overall trial (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Not blinded

Blinding implementation details:

Not blinded.

Arms

Are arms mutually exclusive?	Yes
Arm title	Randomized to usual care

Arm description:

Patients continued to receive usual care

Arm type	No intervention
No investigational medicinal product assigned in this arm	

Arm title	Randomized to dose reduction
------------------	------------------------------

Arm description:

The doses of etanercept, adalimumab or ustekinumab are lowered according to a predefined schedule

Arm type	Active comparator
Investigational medicinal product name	adalimumab
Investigational medicinal product code	
Other name	Humira
Pharmaceutical forms	Injection
Routes of administration	Subcutaneous use

Dosage and administration details:

The dose will be decreased to 66–70% of the normal dose of the biologic (by interval prolongation with a factor 1.5). After 3 months, if the patients remain in a state of low disease activity, the dose will be further reduced to 50% of the original dose (by doubling the original interval). The interval will be prolonged from 14 to 21 to 28 days.

Investigational medicinal product name	etanercept
Investigational medicinal product code	
Other name	Enbrel
Pharmaceutical forms	Injection

Routes of administration	Subcutaneous use
Dosage and administration details:	
The dose will be decreased to 66–70% of the normal dose of the biologic (by interval prolongation with a factor 1.5). After 3 months, if the patients remain in a state of low disease activity, the dose will be further reduced to 50% of the original dose (by doubling the original interval). The interval will be prolonged stepwise from 7 days to 10 days to 14 days.	
Investigational medicinal product name	ustekinumab
Investigational medicinal product code	
Other name	Stelara
Pharmaceutical forms	Injection
Routes of administration	Subcutaneous use

Dosage and administration details:

The dose will be decreased to 66–70% of the normal dose of the biologic (by interval prolongation with a factor 1.5). After 3 months, if the patients remain in a state of low disease activity, the dose will be further reduced to 50% of the original dose (by doubling the original interval). The interval will be stepwise increased from 12 to 18 to 24 weeks

Number of subjects in period 1	Randomized to usual care	Randomized to dose reduction
Started	60	60
Completed	58	53
Not completed	2	7

Analysis specification	Pre-specified
Analysis type	non-inferiority
P-value	< 0.05
Method	ANCOVA

Secondary: Proportion of patients with successful dose tapering

End point title	Proportion of patients with successful dose tapering ^[1]
-----------------	---

End point description:

End point type	Secondary
----------------	-----------

End point timeframe:

After 12 months

Notes:

[1] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period.

Justification: End point reports on number of patients that successfully tapered their dose. This is not applicable to patients that continued to receive usual care.

Blood and lymphatic system disorders Infection subjects affected / exposed occurrences (all)	37 / 59 (62.71%) 73	40 / 59 (67.80%) 70	
Skin and subcutaneous tissue disorders Psoriatic arthritis subjects affected / exposed occurrences (all) Skin event subjects affected / exposed occurrences (all)	1 / 59 (1.69%) 1 7 / 59 (11.86%) 10	1 / 59 (1.69%) 1 4 / 59 (6.78%) 4	
Musculoskeletal and connective tissue disorders Musculoskeletal disorder subjects affected / exposed occurrences (all)	4 / 59 (6.78%) 4	13 / 59 (22.03%) 13	

Notes:

[1] - The number of subjects exposed to this adverse event is less than the total number of subjects exposed for the reporting group. These numbers are expected to be equal.

Justification: not all elective surgery cases were considered SAEs

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? No

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

1) Open-label design, 2) an absolute PASI score instead of a relative PASI score, 3) dose reduction led to higher topical treatment use and more visits, 4) for per-dsrug conclusions, study was underpowered, 5) no general flare criterion for psorias
