## General information about the trial

Main objective of the trial:

The primary objective of this study was to evaluate the efficacy of monthly doses of aducanumab in slowing cognitive and functional impairment as measured by changes in the Clinical Dementia Rating-Sum of Boxes (CDR-SB) score as compared with placebo in subjects with early Alzheimer's Disease (AD).

Protection of trial subjects:

Written informed consent was obtained from each subject or subject's legally authorized representative (e.g., legal guardian), as applicable, prior to evaluations performed for eligibility. Subjects or the subject's legally authorized representative were given adequate time to review the information in the informed consent/assent and were allowed to ask, and have answered, questions concerning all portions of the conduct of the study.

### Primary: Change from Baseline in Clinical Dementia Rating-Sum of Boxes (CDR-SB) Score at Week 78

End point title	Change from Baseline in Clinical Dementia Rating-Sum of Boxes (CDR-SB) Score at Week 78
End point description: CDR-SB integrates assessments from 3 domains of cognition (memory, orientation, judgment/problem-solving) and 3 domains of function (community affairs, home/hobbies, personal care). Following caregiver interview and systematic patient examination, the rater assigns a score describing the subject's current performance level in each of these domains of life functioning. Prespecified severity anchors range from none = 0, questionable = 0.5, mild = 1, moderate = 2 to severe = 3 (the personal care domain omits the 0.5 score). "Sum of boxes" scoring methodology sums the score for each of the 6 domains and provides a value ranging from 0 to 18 that can change in increments of 0.5 or greater. Higher scores indicate greater disease severity. Mixed model for repeated measures (MMRM) analysis was used to analyse change from baseline in CDR-SB. A positive change from baseline indicates clinical decline. Intent-to-Treat (ITT) population. n=number of subjects analysed at specific timepoint.

End point title	Change from Baseline in Mini-Mental State Examination (MMSE) Score at Week 78
-----------------	---

#### End point description:

The MMSE is a widely used performance-based test of global cognitive status. It consists of 11 tasks that assess orientation, word recall, attention and calculation, language abilities, and visuospatial functions. The scores from the 11 tests are combined to obtain the total score, which ranges from 0 to 30, with lower scores over time indicating increasing cognitive impairment. MMRM analysis was used to analyse change from baseline in MMSE. A negative change from baseline indicates clinical decline. ITT is defined as all randomised subjects who had received at least one dose of study treatment (Aducanumab or Placebo). Here, 'n' signifies number of subjects analysed at specific timepoint.

From First Dose to End of Study (up to 4 years)

Adverse event reporting additional description:

Safety population was all randomised subjects who received at least one dose of study treatment. In PC period, 5 subjects randomised to placebo, inadvertently received 1 or more doses of active treatment during the PC period. For subjects affected, a subject was counted only once within each system organ class/preferred term/study period.

## More information

### Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
21 July 2016	(1) To allow subjects who suspend dosing after a first observance of amyloid-related imaging abnormalities (ARIA) to (a) restart at the same dose (rather than at the next lower dose) after ARIA resolution and (b) titrate up to the originally assigned dose (rather than continue on the next lower dose for the duration of the study), (2) Removed requirement to permanently discontinue treatment after severe symptomatic ARIA or serious ARIA ("other medically important" criteria only); instead, in such subjects, dosing could be suspended and then resumed at the same dose after ARIA and symptoms resolved or stabilized, (3) to clarify dosing and monitoring frequency when ARIA occurs during titration, (4) Regarding the management of recurrent ARIA, the amendment (a) allowed subjects who had suspended dosing after a second episode to restart dosing, after ARIA resolution, at the next lower dose and continue uptitration (rather than remaining on the restart dose) and (b) required treatment discontinuation after 3 ARIA episodes (rather than requiring a third dose reduction with Sponsor approval).
24 March 2017	To allow ApoE ε4 carrier subjects randomised to aducanumab high-dose to receive the same aducanumab high-dose regimen already received by ApoE ε4 noncarriers (i.e., per this amendment, the high dose for carriers was changed from 6 to 10 milligrams per kilograms (mg/kg), which was also the high-dose for noncarriers).
18 September 2017	(1) To update the percentage of primary endpoint data estimated to be available at the time of a potential blinded sample size re-estimation, (2) To provide additional details on the planned sample size re-estimation (including the maximum potential sample size), (3) To add information on an additional concentration and formulation for aducanumab used in the study.
28 June 2018	(1) To reflect the agreement of the data monitoring committee that the characteristics or outcomes of the first event and recurrent events of ARIA were similar, the management of recurrent ARIA was modified so that a third episode of ARIA that requires dose suspension will no longer require study treatment discontinuation, and after recurrent ARIA resolves or stabilizes, dosing will resume at the same dose, (2) To extend the study such that subjects nearing study completion under Protocol Version 5 can continue in the study and receive treatment until either the subject's End of Treatment Visit at Week 338 (an additional 3 years of treatment) or until the last subject has had his or her Week 182 Visit, whichever occurs first, (3) To adjust the sample size from 450 to 535 subjects per treatment group following the blinded sample size re-estimation to ensure adequate power to detect a mean treatment effect of 0.5 for the primary endpoint.

Notes:

### Interruptions (globally)

Were there any global interruptions to the trial? No

### Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

The study was halted prematurely based on a prespecified futility analysis and not based on safety concerns. Subjects discontinued due to study termination are included in "Reason not Specified" category in subject disposition tables above.
