

Clinical trial results:

Clinical and laboratory evaluation of acute rejection, myocyte growth, repair and oxidative stress following de novo cardiac transplant: A comparison between Tacrolimus and Cyclosporine based immunoprophylactic regimens with mycophenolic acid therapeutic drug monitoring.

Summary

EudraCT number	2015-001041-83
Trial protocol	Outside EU/EEA
Global end of trial date	18 July 2008

Analysis stage	Final
Date of interim/final analysis	18 July 2008
Is this the analysis of the primary completion data?	Yes
Primary completion date	18 July 2008
Global end of trial reached?	Yes
Global end of trial date	18 July 2008
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The primary objective of the trial was to investigate changes in subcellular markers of growth, apoptosis, differentiation, survival, inflammation, and oxidative stress, in relationship with cellular acute rejection, in de novo cardiac transplant recipients receiving either tacrolimus or cyclosporine (CsA) as the primary immunosuppressant.

Protection of trial subjects:

This clinical study was written, conducted and reported in accordance with the protocol, ICH GCP Guidelines, and applicable local regulations, including the European Directive 2001/20/EC, on the protection of human rights, and with the ethical principles that have their origin in the Declaration of Helsinki. Astellas ensures that the use and disclosure of protected health information (PHI) obtained during a research study complies with the federal, national and/or regional legislation related to the privacy and protection of personal information.

Background therapy:

All patients received induction therapy per institutional protocol and adjunctive immunosuppression with mycophenolate mofetil (MMF). Study treatments (tacrolimus and CsA) were administered continuously beginning no earlier than pre-transplant and no later than 10 days post-transplant. Mycophenolate mofetil (MMF) was administered peri-operatively in a pre-operative dose of 1.0 g IV/PO. The post-operative dose of MMF was given within 6 hours of transplantation at 1.0g IV/P for one week post-transplant and then 1.0g PO BID throughout the study period. Methylprednisolone was administered pre-operatively for adult patients and intra-operatively for paediatric patients. Prednisone was administered daily and was tapered slowly throughout the study. It was administered orally daily in Weeks 1 to 4: 20 mg; Week 8: 10 mg ; Week 12: 7.5 mg ; Weeks 16 to 26: 5 mg ; Weeks 27 to 52; 0-5 mg. Prednisone was discontinued after Week 26 according to the investigator's clinical judgment. During the study, all patients were treated with statins to control lipid profiles. The drug pravastatin and simvastatin were recommended as first-line statin therapy. Patients also received antihypertensive therapy with angiotensin-converting enzyme (ACE) inhibitors as standard per protocol medical management or prophylaxis of calcineurin inhibitor-induced hypertension. Patients also received ganciclovir either orally or IV for cytomegalovirus (CMV) prophylaxis at the discretion of the investigator.

Evidence for comparator:

Tacrolimus (Tac, FK506) and cyclosporine (CsA) have played a major role in the control of acute rejection (AR) in all organ transplants. Tacrolimus-based immunoprophylaxis resulted in 50% less development of hypertension, lower cholesterol and low-density lipoprotein (LDL) - cholesterol, and better preservation of renal function in both cardiac and renal transplant recipients. The dosing of CsA, MMF, and corticosteroids was based on current standards of practice for the use of these products in immunoprophylaxis of cardiac transplant patients.

Actual start date of recruitment	10 May 2004
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Canada: 93
Country: Number of subjects enrolled	United States: 18
Worldwide total number of subjects	111
EEA total number of subjects	0

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	2
Children (2-11 years)	5
Adolescents (12-17 years)	4
Adults (18-64 years)	90
From 65 to 84 years	10
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

Adult and pediatric (from birth) male and female de novo recipients of cadaveric heart transplants.

Pre-assignment

Screening details:

Screening(pre-transplant)period was Day -180 to -1;transplant was Day 0;Randomization conducted Days 0-10 post-transplant;133 adults were screened;100 were randomized and 17 pediatric participants were screened; 11 randomized.Patients were assigned treatment with either tacrolimus or cyclosporine in a 1:1 ratio within 10 days post-transplantation.

Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	No
Arm title	Tacrolimus - Adult

Arm description:

Adult primary cadaveric heart transplant recipients randomized to immunosuppression with Tacrolimus 0.05 – 0.10 mg/ kg/ day administered orally in 2 divided doses starting within 10 days of transplant.

Arm type	Experimental
Investigational medicinal product name	Tacrolimus-Adult Dose
Investigational medicinal product code	FK506
Other name	Prograf®
Pharmaceutical forms	Capsule
Routes of administration	Oral use

Dosage and administration details:

Adult Dose: Tacrolimus 0.05 to 0.10 mg/kg/day in 2 divided doses starting within 10 days of transplant supplied as 5-, 1-, or 0.5-mg capsules. Tacrolimus was administered on an empty stomach, 1 hour before or 2 hours after meals. Study treatments were administered continuously beginning no earlier than pre-transplant and no later than 10 days post-transplant.In the event that therapeutic levels could not be achieved with oral capsules in the immediate post-operative period, use of commercially-obtained tacrolimus intravenous (IV) solution (Prograf® IV 5mg/mL) was permitted.

Arm title	Cyclosporine – Adult
------------------	----------------------

Arm description:

Adult primary cadaveric heart transplant recipients randomized to immunosuppression with Cyclosporine 3-5 mg/kg/day administered orally in 2 divided doses starting within 10 days of transplant.

Arm type	Experimental
Investigational medicinal product name	Cyclosporine-Adult
Investigational medicinal product code	
Other name	Neoral
Pharmaceutical forms	Capsule, soft
Routes of administration	Oral use

Dosage and administration details:

Adult Dose: Starting within 10 days of transplant supplied as 10-, 25-, 50-, or 100-mg capsules. Study treatments were administered continuously beginning no earlier than pre-transplant and no later than 10 days post-transplant. In the event that therapeutic levels could not be achieved with oral capsules in the immediate post-operative period, use of commercially-obtained CsA IV solution (Sandimmune® IV 50 mg/mL) was permitted.

Arm title	Tacrolimus – Pediatric
Arm description: Pediatric primary cadaveric heart transplant transplant recipients randomized to immunosuppression with Tacrolimus 0.05-0.30 mg/kg/day administered orally in 2 or 3 divided doses starting within 10 days of transplant.	
Arm type	Experimental
Investigational medicinal product name	Tacrolimus-Pediatric Dose
Investigational medicinal product code	FK506
Other name	Prograf®
Pharmaceutical forms	Capsule
Routes of administration	Oral use

Dosage and administration details:

Pediatric Dose: Oral Prograf® 0.05-0.30 mg/kg/day was given in two divided doses, beginning no earlier than pre-transplant and no later than day 10 post-transplant. Tacrolimus was administered on an empty stomach, 1 hour before or 2 hours after meals. Tacrolimus may have been administered via nasogastric tube. Intravenous administration of tacrolimus should have been undertaken only when therapeutic levels could be achieved via oral and enteric routes. Intravenous dosing of tacrolimus, if required, is by administration as a continuous 24-hour infusion. Tacrolimus IV solution should be diluted in 0.9% sodium chloride or 5% dextrose for injection and stored in a glass bottle or non-polyvinyl chloride (PVC) bag for no longer than 24 hours prior to infusion. Dose decreases for mild intolerance should be based on balancing other clinical assessments, e.g., acute rejection.

Arm title	Cyclosporine – Pediatric
Arm description: Pediatric primary cadaveric heart transplant transplant recipients randomized to immunosuppression with Cyclosporine 6-10 mg/kg/day in 2 or 3 divided doses starting within 10 days of transplant.	
Arm type	Active comparator
Investigational medicinal product name	Cyclosporine - Pediatric Dose
Investigational medicinal product code	
Other name	Neoral®
Pharmaceutical forms	Capsule
Routes of administration	Oral use

Dosage and administration details:

Pediatric Dose: Pediatric patients: Administration of the Neoral® form of cyclosporine must start within the first 10 days post transplant. It will be given at a starting dose of 6-10 mg/kg per day orally in 2 or 3 divided doses based on actual body weight unless the patient has significant renal dysfunction. The dose will subsequently be adjusted to achieve the targeted blood levels. Intravenous dosing of cyclosporine, if required, is to be initiated as a continuous 24-hour infusion of 1-2 mg/kg over 24 hours. For IV administration 1 mg/kg of IV cyclosporine should be diluted in 0.9% sodium chloride for injection or 5% dextrose for injection and stored in a glass bottle for no greater than 24 hours prior to infusion. The cyclosporine dose should be decreased in the presence of adverse events as clinically warranted. Dose decreases for mild intolerance should be based on balancing other clinical assessments, for example, acute rejection.

Number of subjects in period 1^[1]	Tacrolimus - Adult	Cyclosporine – Adult	Tacrolimus – Pediatric

Death	1
Other	-
Patient would not have received transplant	-
Physician Discretion	-
Patient withdrawn at investigator's discretion	-
Medications withdrawn on request of family	-
Joined	0
Transferred in from other group/arm	-

Notes:

[1] - The number of subjects transferring in and out of the arms in the period are not the same. It is expected the net number of transfers in and out of the arms in a period, will be zero.

Justification: Three patients randomized to cyclosporine actually received tacrolimus and were included in the Treatment Exposure Population for tacrolimus. Two patients randomized for tacrolimus were excluded from Treatment Exposure Population – 1 never received drug; 1 received incorrect drug without a waiver.

Primary: The change in the markers of growth, apoptosis, inflammation and oxidation measured in endomyocardial biopsies (TE)

End point title	The change in the markers of growth, apoptosis, inflammation and oxidation measured in endomyocardial biopsies (TE) ^{[1][2]}
End point description: The markers assessed were p-ERK ½ (phosphorylated extracellular signal-regulated kinase), p-JNK (phosphorylated jun N-terminal kinase) and p-p38 MAPK (phosphorylated mitogen-activated protein kinase). The data for each biopsy marker were expressed as a ratio of its densitometry / densitometry of glyceraldehyde-3-phosphate dehydrogenase (GAPDH). Change is defined as Week 52 assessment- Week 2 assessment. The number of participants analyzed per arm represents Treatment Exposure (TE) Population- defined as all patients receiving at least 1 dose of study medication summarized according to treatment received regardless of randomization allocation. The number of participants included in the calculation for each marker is noted in the category titles, as "N".	
End point type	Primary
End point timeframe: 2 Weeks and 52 Weeks	

Notes:

[1] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: No statistical analysis provided.

[2] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period.

Justification: Summary statistical analysis is only applicable to adult population which is why arms representing only adult population are selected for this endpoint.
