

Clinical trial results:

Efficacy and Safety of Faster-acting Insulin Aspart compared to NovoRapid® both in combination with Insulin Degludec in Adults with Type 1 Diabetes

Summary

EudraCT number	2015-001047-36
Trial protocol	BG DE AT IT
Global end of trial date	16 August 2017

Results information

Result version number	v1 (current)
This version publication date	30 August 2018
First version publication date	30 August 2018

Trial information

Trial identification

Sponsor protocol code	NN1218-4131

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	13 March 2018
Is this the analysis of the primary completion data?	Yes
Primary completion date	17 July 2017
Global end of trial reached?	Yes
Global end of trial date	16 August 2017
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

To confirm the effect in terms of glycaemic control of treatment with mealtime faster-acting insulin aspart in combination with insulin degludec in adults with type 1 diabetes mellitus

Protection of trial subjects:

The trial was conducted in accordance with the Declaration of Helsinki (2013) and ICH GCP (1996) and FDA 21 CFR 312.120.

Background therapy:

Not applicable

Evidence for comparator:

Not applicable

Actual start date of recruitment	04 May 2016
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Austria: 24
Country: Number of subjects enrolled	Bulgaria: 72
Country: Number of subjects enrolled	Canada: 32
Country: Number of subjects enrolled	Germany: 45
Country: Number of subjects enrolled	India: 103
Country: Number of subjects enrolled	Israel: 33
Country: Number of subjects enrolled	Italy: 41
Country: Number of subjects enrolled	Japan: 245
Country: Number of subjects enrolled	Russian Federation: 92
Country: Number of subjects enrolled	Serbia: 38
Country: Number of subjects enrolled	Taiwan: 31
Country: Number of subjects enrolled	United States: 269
Worldwide total number of subjects	1025
EEA total number of subjects	182

Notes:

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	964
From 65 to 84 years	61
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

The trial was conducted at 146 sites in 12 countries (number of sites indicates those that both screened and randomised subjects, unless otherwise noted)-Austria(4); Bulgaria(8); Canada(6); Germany(7); India(16); Israel(6); Italy(4); Japan(24); Russian Federation(10); Serbia(3); Taiwan(3); United States(55 sites screened/52 sites randomised subjects)

Pre-assignment

Screening details:

Eligible subjects were enrolled in an 8-week run-in period (1108 subjects) where subjects were switched from previous insulin treatment to insulin degludec once daily, and NovoRapid®/NovoLog® as mealtime bolus insulin. The basal insulin treatment was optimised using treat-to-target approach. 83 subjects were run-in failures and 1025 were randomised.

Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Investigator, Subject

Blinding implementation details:

The trial was partly double-blinded. The bolus treatment was double-blind for the mealtime faster aspart and NovoRapid®/NovoLog® treatment arms and open-label for the postmeal faster aspart treatment arm.

Arms

Are arms mutually exclusive?	Yes
Arm title	Faster aspart (meal)

Arm description:

Bolus insulin: Participants received subcutaneous (s.c., into the abdominal wall) injections of faster-acting insulin aspart at mealtime (0–2 minutes before the meal) during 26-week treatment period. Throughout the trial, the insulin was administered at each of the three main meals (i.e. breakfast, lunch and main evening meal). The insulin was titrated to the glycaemic target of pre-prandial and bedtime plasma glucose between 4.0–6.0 mmol/L (71–108 mg/dL) in a treat-to-target fashion.

Basal insulin: Participants continued insulin degludec once daily s.c. injections at the dose optimized during run-in period during 26-week treatment period.

Arm type	Experimental
Investigational medicinal product name	Faster-acting insulin aspart
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection
Routes of administration	Subcutaneous use

Dosage and administration details:

Faster-acting insulin aspart was administered 0–2 minutes before each of the three main meals (i.e. breakfast, lunch and main evening meal). No adjustments of faster-acting insulin aspart dose was performed by the investigator during run-in. During the 26-week treatment period, the investigator focussed on optimising the bolus insulin. The bolus insulin was titrated to the glycaemic target of pre-prandial and bedtime plasma glucose between 4.0–6.0 mmol/L [71–108 mg/dL] in a treat-to-target fashion.

Investigational medicinal product name	Insulin degludec
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection
Routes of administration	Subcutaneous use

Dosage and administration details:

Insulin degludec was administered once daily at any time of the day, preferably at the same time every day and injected subcutaneously into the thigh, or upper arm (deltoid area). During the 8-week run-in period, the investigator focussed on optimising the treatment by using a treat-to-target approach; the basal insulin was titrated by the investigator on a weekly basis to the pre-breakfast glycaemic target of 4.0-5.0 mmol/L (71-90 mg/dL). Further adjustments of the basal insulin dose during the treatment period were done at the discretion of the Investigator, if needed.

Arm title	Faster aspart (post)
------------------	----------------------

Arm description:

Bolus insulin: Participants received s.c. injections of faster-acting insulin aspart at mealtime (injecting the bolus insulin at the end of the meal but no later than 20 minutes after the start of the meal) during 26-week treatment period. Throughout the trial, the insulin was administered at each of the three main meals (i.e. breakfast, lunch and main evening meal). The insulin was titrated to the glycaemic target of pre-prandial and bedtime plasma glucose between 4.0–6.0 mmol/L (71–108 mg/dL) in a treat-to-target fashion.

Basal insulin: Participants continued insulin degludec once daily s.c. injections at the dose optimized during run-in period during 26-week treatment period.

Arm type	Experimental
Investigational medicinal product name	Faster-acting insulin aspart
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection
Routes of administration	Subcutaneous use

Dosage and administration details:

Faster-acting insulin aspart was administered at the end of the meal but no later than 20 minutes after the start of the meal (i.e. breakfast, lunch and main evening meal). No adjustments of faster-acting insulin aspart dose was performed by the investigator during run-in. During the 26-week treatment period, the investigator focussed on optimising the bolus insulin. The bolus insulin was titrated to the glycaemic target of pre-prandial and bedtime plasma glucose between 4.0–6.0 mmol/L [71–108 mg/dL] in a treat-to-target fashion.

Investigational medicinal product name	Insulin degludec
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection
Routes of administration	Subcutaneous use

Dosage and administration details:

Insulin degludec was administered once daily at any time of the day, preferably at the same time every day and injected subcutaneously into the thigh, or upper arm (deltoid area). During the 8-week run-in period, the investigator focussed on optimising the treatment by using a treat-to-target approach; the basal insulin was titrated by the investigator on a weekly basis to the pre-breakfast glycaemic target of 4.0-5.0 mmol/L (71-90 mg/dL). Further adjustments of the basal insulin dose during the treatment period were done at the discretion of the Investigator, if needed.

Arm title	NovoRapid (meal)
------------------	------------------

Arm description:

After 8-week run-in period, subjects continued using mealtime insulin aspart (NovoRapid®/NovoLog®) s.c. injections at mealtime (0–2 minutes before the meal) during 26-week treatment period. Throughout the trial, the insulin was administered at each of the three main meals (i.e. breakfast, lunch and main evening meal). The insulin was titrated to the glycaemic target of pre-prandial and bedtime plasma glucose between 4.0–6.0 mmol/L (71–108 mg/dL) in a treat-to-target fashion.

Basal insulin: Participants continued insulin degludec once daily s.c. injections at the dose optimized during run-in period during 26-week treatment period.

Arm type	Active comparator
Investigational medicinal product name	Insulin aspart
Investigational medicinal product code	
Other name	NovoRapid®/NovoLog®
Pharmaceutical forms	Solution for injection
Routes of administration	Subcutaneous use

Dosage and administration details:

Insulin aspart was administered 0–2 minutes before each of the three main meals (i.e. breakfast, lunch

and main evening meal). No adjustments of faster-acting insulin aspart dose was performed by the investigator during run-in. During the 26-week treatment period, the investigator focussed on optimising the bolus insulin. The bolus insulin was titrated to the glycaemic target of pre-prandial and bedtime plasma glucose between 4.0–6.0 mmol/L [71–108 mg/dL] in a treat-to-target fashion.

Statistical analyses

Statistical analysis title	Faster aspart (meal) vs. NovoRapid (meal)
Statistical analysis description:	
The endpoint was analysed using an analysis of variance model after multiple imputation assuming treatment according to randomisation. The model includes treatment, region and bolus adjusting method at randomisation as factors, and baseline HbA1c as a covariate.	
Comparison groups	NovoRapid (meal) v Faster aspart (meal)
Number of subjects included in analysis	684
Analysis specification	Pre-specified
Analysis type	non-inferiority ^[1]
P-value	< 0.001 ^[2]
Method	ANOVA model after multiple imputation
Parameter estimate	Treatment difference
Point estimate	-0.02
Confidence interval	
level	95 %
sides	2-sided
lower limit	-0.11
upper limit	0.07

Notes:

[1] - Stepwise hierarchical testing procedure was applied for confirmatory endpoints:
Step 1: Primary analysis: HbA1c non-inferiority of mealtime faster aspart versus mealtime NovoRapid®/NovoLog®.

Non-inferiority of mealtime faster aspart was considered confirmed if the upper boundary of the two-sided 95% CI was below or equal to 0.4%

[2] - p-values are from the 1-sided test for non-inferiority evaluated at the 2.5% level

Statistical analysis title	Faster aspart (meal) vs. NovoRapid (meal)
Statistical analysis description:	
The endpoint was analysed using an analysis of variance model after multiple imputation assuming treatment according to randomisation. The model includes treatment, region and bolus adjusting method at randomisation as factors, and baseline HbA1c as a covariate.	
Comparison groups	Faster aspart (meal) v NovoRapid (meal)
Number of subjects included in analysis	684
Analysis specification	Pre-specified
Analysis type	superiority ^[3]
P-value	= 0.633 ^[4]
Method	ANOVA model after multiple imputation
Parameter estimate	Treatment difference
Point estimate	-0.02
Confidence interval	
level	95 %
sides	2-sided
lower limit	-0.11
upper limit	0.07

Notes:

[3] - Stepwise hierarchical testing procedure was applied for confirmatory endpoints:
Step 4: HbA1c superiority of mealtime faster aspart versus mealtime NovoRapid®/NovoLog®.

Superiority was to be confirmed if the upper boundary of the two-sided 95% CI of the mean treatment difference (mealtime faster aspart minus mealtime NovoRapid®/NovoLog®) was below 0%-points

[4] - p-value from the 2-sided test for treatment difference evaluated at the 5% level

Statistical analysis title	Faster aspart (post) vs. NovoRapid (meal)
Statistical analysis description:	
The endpoint was analysed using an analysis of variance model after multiple imputation assuming treatment according to randomisation. The model includes treatment, region and bolus adjusting method at randomisation as factors, and baseline HbA1c as a covariate.

Notes:

[9] - Stepwise hierarchical testing procedure was applied for confirmatory endpoints:
Step 5: 1,5-anhydroglucitol superiority of mealtime faster aspart versus mealtime NovoRapid®/NovoLog®.

Superiority was to be confirmed if the lower boundary of the two-sided 95% CI of the mean treatment difference (mealtime faster aspart minus mealtime NovoRapid®/NovoLog®) was above 0.

[10] - p-values are from the 2-sided test for treatment difference evaluated at the 5% level.

Adverse events

Adverse events information

Timeframe for reporting adverse events:

Week 0 to week 26 (+7 days)

Adverse event reporting additional description:

A TEAE was defined as an event that had an onset date on or after the first day of exposure to randomised treatment, and no later than seven days after the last day of randomised treatment.

Assessment type	Systematic

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
01 February 2016	<ol style="list-style-type: none">1. Introduction of estimands into the protocol with emphasis on using the in-trial observation period for the primary estimand: Significant changes to statistical analysis section to accommodate this (primary analysis, sensitivity analysis, wording of endpoints). Differentiation between trial drug discontinuation and trial discontinuation.2. Introduction of premature discontinuation visit into trial design.3. Addition of sections describing criteria for run-in failure and for premature discontinuation of trial product.4. Addition of sections describing how subjects that discontinue trial product prematurely should be followed and how a subject can withdraw from the trial.5. Addition of section describing choice of non-inferiority margin.6. Order of hierarchical testing changed.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
