Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	Yes

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	13 December 2017
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	13 November 2017
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

To evaluate the efficacy of dupilumab, compared with placebo, for reducing the use of maintenance oral corticosteroids (OCS) in subjects with severe steroid-dependent asthma.

Protection of trial subjects:

Paediatric Subjects: The study was conducted by investigators experienced in the treatment of paediatric subjects. The parent(s) or guardian(s) as well as the children were fully informed of all pertinent aspects of the clinical trial as well as the possibility to discontinue at any time. In addition to the consent form for the parent(s)/guardian(s), an assent form in child-appropriate language was provided and explained to the child. Repeated invasive procedures were minimized. The number of blood samples as well as the amount of blood drawn were adjusted according to age and weight. A topical anaesthesia may have been used to minimize distress and discomfort. Adult Subjects: Subjects were fully informed of all pertinent aspects of the clinical trial as well as the possibility to discontinue at any time in language and terms appropriate for the subject and considering the local culture. The following applies to both Paediatric and Adult Subjects: During the course of the trial, subjects were provided with individual subject cards indicating the nature of the trial the subject is participating, contact details and any information needed in the event of a medical emergency. Collected personal data and human biological samples were processed in compliance with the Sanofi-Aventis Group Personal Data Protection Charter ensuring that the Group abides by the laws governing personal data protection in force in all countries in which it operates.

Background therapy:

Oral corticosteroids (OCS [(prednisone or prednisolone)]) therapy and stable high dose of inhaled corticosteroid (ICS) in combination with a second or third controller medication for at least 1 month prior to screening and continued throughout the study. Albuterol/salbutamol or levalbuterol/levosalbutamol was given as reliever medication.

Evidence for comparator: -

Actual start date of recruitment	15 October 2015
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

EEA total number of subjects	92

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	3
Adults (18-64 years)	179
From 65 to 84 years	28
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

The study was conducted at 68 centers in 17 countries. A total of 390 subjects were screened between October 2015 & April 2017, of which 210 were randomized & treated. 180 subjects were screen failures mainly due to exclusion criteria met & inclusion criteria not met. Assignment was done by Interactive Voice/Web Response System (IVRS/IWRS).

Pre-assignment

Screening details:

The screening period included an OCS optimization phase (up to 10 weeks) where subjects using OCS other than prednisone/prednisolone switched to these OCS. At the end of period, subjects were randomized in 1:1 ratio for dupilumab & placebo. Randomization was stratified by optimized OCS dose (≤ 10 mg/day & > 10 mg/day) at randomization visit & by country.

Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Investigator, Carer, Subject

Arms

Are arms mutually exclusive?	Yes
Arm title	Placebo q2w

Arm description:

2 subcutaneous injections of Placebo (for Dupilumab) as a loading dose on Day 1, followed by a single injection every 2 weeks (q2w) for 24 weeks in combination with OCS - (prednisone or prednisolone) and stable ICS. OCS dose was reduced according to a predetermined titration schedule every 4 weeks until week 20.

Arm type	Experimental
Investigational medicinal product name	Placebo (for Dupilumab)
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection in pre-filled syringe
Routes of administration	Subcutaneous use

Dosage and administration details:

Subcutaneous injection (2 ml) in the abdomen or upper thigh or upper arm.

Arm title	Dupilumab 300 mg q2w
------------------	----------------------

Arm description:

2 subcutaneous injections of Dupilumab 300 mg (for a total of 600 mg) as a loading dose on Day 1, followed by a single 300 mg injection q2w for 24 weeks in combination with OCS - (prednisone or prednisolone) and stable ICS. OCS dose was reduced according to a predetermined titration schedule every 4 weeks until week 20.

Arm type	Experimental
Investigational medicinal product name	Dupilumab
Investigational medicinal product code	SAR231893, REGN668
Other name	
Pharmaceutical forms	Solution for injection in pre-filled syringe
Routes of administration	Subcutaneous use

Dosage and administration details:

Subcutaneous injection (300 mg/2 ml) in the abdomen, upper thigh or upper arm.

Number of subjects in period 1	Placebo q2w	Dupilumab 300 mg q2w
Started	107	103
Treated	107	103
Completed	107	100

Baseline Optimized Daily OCS Dose			
During screening period and before randomization, dose of OCS was adjusted in each subject to achieve the lowest OCS dose, also known as the optimized dose, required for management of the subject's asthma. Subjects using OCS medications other than prednisone or prednisolone were switched to either of these corticosteroids at a dose clinically comparable to their current stable OCS dose. To optimize the OCS dose, investigators were instructed to adjust the OCS dose weekly according to a pre-specified titration schedule, based on changes in subject's asthma control, and their clinical judgment.			
Units: mg/day			
arithmetic mean	11.75	10.75	
standard deviation	± 6.31	± 5.90	-

End points

End points reporting groups

Reporting group title	Placebo q2w
Reporting group description: 2 subcutaneous injections of Placebo (for Dupilumab) as a loading dose on Day 1, followed by a single injection every 2 weeks (q2w) for 24 weeks in combination with OCS - (prednisone or prednisolone) and stable ICS. OCS dose was reduced according to a predetermined titration schedule every 4 weeks until week 20.	
Reporting group title	Dupilumab 300 mg q2w
Reporting group description: 2 subcutaneous injections of Dupilumab 300 mg (for a total of 600 mg) as a loading dose on Day 1, followed by a single 300 mg injection q2w for 24 weeks in combination with OCS - (prednisone or prednisolone) and stable ICS. OCS dose was reduced according to a predetermined titration schedule every 4 weeks until week 20.	

Primary: Percentage Reduction From Baseline in Oral Corticosteroids (OCS) Dose at Week 24 While Maintaining Asthma Control

End point title	Percentage Reduction From Baseline in Oral Corticosteroids (OCS) Dose at Week 24 While Maintaining Asthma Control
End point description: Percentage reduction of OCS dose was calculated as (optimized OCS dose [mg/day] at baseline - final OCS dose at Week 24)/optimized OCS dose at baseline x 100. Result is presented as Least Squares Mean (Standard Error) percentage reduction from baseline derived from ANCOVA model with missing data multiply imputed. Analysis was performed on intent-to- treat (ITT) population which included randomized population analyzed according to the treatment group allocated by randomization regardless of whether the treatment kit was used or not.	
End point type	Primary
End point timeframe: Baseline, Week 24	

End point values	Placebo q2w	Dupilumab 300 mg q2w		
Subject group type	Reporting group	Reporting group		
Number of subjects analysed	107	103		
Units: percentage reduction from baseline				
least squares mean (standard error)	41.85 (± 4.57)	70.09 (± 4.90)		

Statistical analyses

Statistical analysis title	Dupilumab vs. Placebo
Statistical analysis description: The endpoint was analyzed using analysis of covariance (ANCOVA) model which included percentage reduction of OCS dose at Week 24 as the response variable, and treatment group, baseline eosinophil level, optimized OCS dose at baseline, region as covariates. Missing data was imputed using a pattern mixture model by multiple imputation approach.	
Comparison groups	Dupilumab 300 mg q2w v Placebo q2w

Number of subjects included in analysis	210
Analysis specification	Pre-specified
Analysis type	superiority ^[1]
P-value	< 0.0001 ^[2]
Method	ANCOVA
Parameter estimate	Least square (LS) mean difference
Point estimate	28.24
Confidence interval	
level	95 %
sides	2-sided
lower limit	15.81
upper limit	40.67

Notes:

[1] - A hierarchical testing procedure was used to control the overall type I error. Testing was then performed sequentially in order the endpoints are reported and continued when previous endpoint was statistically significant at two-sided 0.05. Only the primary and the first 4 secondary endpoints were included in the procedure.

[2] - Threshold for significance at two-sided 0.05 level. LS mean difference represents reduction difference i.e. dupilumab - placebo.

Primary: Supplementary Presentation of Primary Endpoint Data: Median Percentage Reduction From Baseline in Oral Corticosteroids Dose at Week 24 While Maintaining Asthma Control

End point title	Supplementary Presentation of Primary Endpoint Data: Median Percentage Reduction From Baseline in Oral Corticosteroids Dose at Week 24 While Maintaining Asthma Control ^[3]
-----------------	--

End point description:

The Primary Endpoint (Percentage Reduction From Baseline in Oral Corticosteroids Dose at Week 24 While Maintaining Asthma Control) is summarized above, as LS Mean (SE). Table below provides a supplementary presentation of the Primary Endpoint data; result is presented as median (inter-quartile range). Percentage reduction of OCS dose was calculated as (optimized OCS dose [mg/day] at baseline - final OCS dose at Week 24)/optimized OCS dose at baseline x 100. Analysis population included ITT patients with available data.

End point type	Primary
----------------	---------

End point timeframe:

Baseline, Week 24

Notes:

[3] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: The Primary Endpoint (Percentage Reduction From Baseline in Oral Corticosteroids Dose at Week 24 While Maintaining Asthma Control) is summarized separately above, as LS Mean (SE), with accompanying ANCOVA statistical analysis. This supplementary presentation of the Primary Endpoint data as median (inter-quartile range) has no separate statistical analysis.

Other pre-specified: Change From Baseline in Asthma Quality of Life Questionnaire (AQLQ) Global Score at Week 12 and Week 24

End point title	Change From Baseline in Asthma Quality of Life Questionnaire (AQLQ) Global Score at Week 12 and Week 24
End point description: AQLQ is a disease-specific, self-administered quality of life questionnaire designed to measure functional impairments that were most important to subjects with asthma. AQLQ comprised of 32 items in 4 domains: symptoms (12 items), activity limitation (11 items), emotional function (5 items), environmental stimuli (4 items). Each item was scored on a 7-point likert scale (1=maximal impairment, 7=no impairment). The 32 items of the questionnaire were averaged to produce one overall quality of life score ranging from 1 (severely impaired) to 7 (not impaired at all). Higher scores indicate better quality of life. Analysis was performed on ITT population. Here, n= subjects with available data for specified categories.

Other pre-specified: Change From Baseline in European Quality of Life Working Group Health Status Measure 5 Dimensions, 5 Levels (EQ-5D-5L) Scores at Week 12 and Week 24

End point title	Change From Baseline in European Quality of Life Working Group Health Status Measure 5 Dimensions, 5 Levels (EQ-5D-5L) Scores at Week 12 and Week 24
End point description: EQ-5D-5L is a standardized health-related quality of life questionnaire developed by EuroQoL Group in order to provide a simple, generic measure of health for clinical and economic appraisal. EQ-5D consists of EQ-5D descriptive system and EQ visual analogue scale (VAS). EQ-5D descriptive system comprises	

of 5 dimensions: mobility, self-care, usual activities, pain/discomfort and anxiety/depression. The 5D-5L systems are converted into a single index utility score between 0 to 1, where higher score indicates a better health state. EQ-5D-5L-VAS records subject's self-rated health on a vertical VAS that allows them to indicate their health state that can range from 0 (worst imaginable) to 100 (best imaginable). Analysis was performed on ITT population. Here, "n"=subjects with available data for specified categories.

Other pre-specified: Change From Baseline in Hospital Anxiety and Depression Scale (HADS) Total Score at Week 12 and Week 24

End point title	Change From Baseline in Hospital Anxiety and Depression Scale (HADS) Total Score at Week 12 and Week 24
-----------------	---

End point description:

The HADS is a general scale to detect states of anxiety and depression already used and validated in asthma, which includes HADS-A and HADS-D subscales. The instrument is comprised of 14 items: 7 related to anxiety (HADS-A) and 7 to depression (HADS-D). Each item on the questionnaire is scored from 0-3. And, the total score is the sum of the scores of the 14 items ranging from 0 (no symptoms) to 42 (severe symptoms), with higher scores indicating higher anxiety/depression complains. Analysis was performed on ITT population. Here, "n" signifies number of subjects with available data for specified categories.

Other pre-specified: Change From Baseline in Sino Nasal Outcome Test-22 (SNOT-22) Global Score at Week 12 and Week 24

End point title	Change From Baseline in Sino Nasal Outcome Test-22 (SNOT-22) Global Score at Week 12 and Week 24
End point description:	
The SNOT-22 is a validated measure of health related quality of life in sino nasal disease. It is a 22 item questionnaire with each item assigned a score ranging from 0-5. The total score may range from 0 (no disease) -110 (worst disease), lower scores represent better health related quality of life. Analysis was performed on ITT population with bilateral nasal polypsis/chronic rhinosinusitis. Here "n" = subjects with available data for specified categories.

Other pre-specified: Annualized Rate of Severe Exacerbation Events During The 24-Week Treatment Period

End point title	Annualized Rate of Severe Exacerbation Events During The 24-Week Treatment Period
-----------------	---

End point description:

A severe asthma exacerbation event was defined as a deterioration of asthma during the 24-week treatment period requiring: use of systemic corticosteroids for ≥ 3 days (at least double the dose currently used); and/or hospitalization related to asthma symptoms or emergency room visit because of asthma requiring intervention with a systemic corticosteroid treatment. Annualized event rate was the total number of exacerbations that occurred during the treatment period divided by the total number of subject-years treated. Analysis was performed on ITT population.

Adverse events

Adverse events information

Timeframe for reporting adverse events:

All Adverse Events (AE) were collected from signature of the informed consent form up to the final visit (Week 36) regardless of seriousness or relationship to investigational product.

Adverse event reporting additional description:

Reported AEs were treatment emergent (TE) AEs developed/worsened during 'TE period' (from first dose of study drug injection until 98 days after last dose of drug or entry in LTS12551 study). Safety population included all subjects who actually received at least 1 dose/part of a dose of IMP and analyzed according to treatment actually received.

Assessment type	Systematic

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
20 July 2016	Following changes were made: - Added instructions to allow the investigator to stop the downward titration of OCS in case of a safety concern; - Modified the forced expiratory volume in 1 second (FEV1) inclusion criteria for screening period and prior to randomization; - Deleted the exclusion criteria on birth control for male subjects with a female partner of childbearing potential; - Modification of the definition of the adverse events of special interest (AESIs) for infections, opportunistic infections, and the reporting requirements for systemic allergic reactions related to IMP and requiring treatment; - Updated the list of controller medications; - Modified the criteria for temporary treatment discontinuation to include infection and infestation that do not respond to medical treatment and updated the list of criteria for permanent treatment discontinuation to be consistent with changes to AESI criteria; - Provided clarification of hepatitis serology testing and interpretation of the results in context of eligibility criteria; - Added chest X-Ray or magnetic resonance imaging (MRI) at Visit 10 for subjects who planned to roll over into a long term study.
25 January 2017	Following changes were made: Increased the number of subjects to be enrolled from 150 to 180.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
