Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	11 April 2018
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	04 December 2017
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The purpose of this study was to establish the safety and efficacy of the subcutaneous (sc) formulation of reslizumab in patients with oral corticosteroid (OCS) dependent asthma and elevated blood eosinophils.

The primary objective of this study is to determine the ability of reslizumab (110 mg) administered subcutaneously (sc) once every 4 weeks to produce a corticosteroid-sparing effect (as demonstrated by percent reduction in daily OCS use) in patients with OCS-dependent asthma and elevated blood eosinophils, without loss of asthma control.

Protection of trial subjects:

This study was conducted in full accordance with the International Council for Harmonisation's (ICH) Consolidated Guideline for Good Clinical Practice (GCP) (E6) and any applicable national and local laws and regulations (eg, Code of Federal Regulations [CFR] Title 21, Parts 50, 54, 56, 312, and 314; European Union [EU] Directive 2001/20/EC on the approximation of the laws, regulations, and administrative provisions of the Member States relating to the implementation of GCP in the conduct of clinical trials on medicinal products for human use).

Each investigator was responsible for performing the study in accordance with the protocol, ICH guidelines, and GCP and for collecting, recording, and reporting the data accurately and properly.

Written and/or oral information about the study was provided to all patients in a language understandable by the patients. The information included an adequate explanation of the aims, methods, anticipated benefits, potential hazards, and insurance arrangements in force. Written informed consent was obtained from each patient before any study procedures or assessments were done. It was explained to the patients that they were free to refuse entry into the study and free to withdraw from the study at any time without prejudice to future treatment.

Each patient's willingness to participate in the study was documented in writing in a consent form that was signed by the patient with the date of that signature indicated. Each investigator kept the original consent forms, and copies were given to the patients.

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	1
Adults (18-64 years)	137
From 65 to 84 years	39
85 years and over	0

Subject disposition

Recruitment

Recruitment details: -

Pre-assignment

Screening details:

A total of 273 patients with OCS-dependent severe eosinophilic asthma were screened, and 180 of these patients (at 78 centers) were considered eligible for enrollment. Three of the eligible patients were not randomized due to failure to meet randomization criteria.

Period 1

Period 1 title	Overall Trial (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Monitor, Data analyst

Blinding implementation details:

Patients were randomly assigned to treatment through an IRT. Using this system ensured a balance across treatment groups; no effort was made to maintain a balance among treatment groups within a study center.

Eosinophils and monocytes were redacted from the post baseline differential cell count reports.

Arms

Are arms mutually exclusive?	Yes
Arm title	Placebo

Arm description:

Matching placebo was administered by subcutaneous injection (sc) 1.0 mL every 4 weeks for a total of six doses.

Arm type	Placebo
Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection in pre-filled syringe
Routes of administration	Subcutaneous use

Dosage and administration details:

Placebo was administered by qualified study personnel as subcutaneous injections in the upper arm(s) once every 4 weeks for a total of 6 doses. Drug was supplied in pre-filled syringes.

Arm title	Reslizumab 110 mg
------------------	-------------------

Arm description:

Reslizumab was administered by subcutaneous injection (sc) in a dosage of 110 mg (1.0 mL) every 4 weeks for a total of six doses.

Arm type	Experimental
Investigational medicinal product name	Reslizumab
Investigational medicinal product code	
Other name	CEP38072, Cinqair, Cinqaero
Pharmaceutical forms	Solution for injection in pre-filled syringe
Routes of administration	Subcutaneous use

Dosage and administration details:

Reslizumab 110 mg was administered by qualified study personnel as subcutaneous injections in the upper arm(s) once every 4 weeks for a total of 6 doses. Drug was supplied in pre-filled syringes.

Number of subjects in period 1	Placebo	Reslizumab 110 mg

Reporting group description:	
Reslizumab was administered by subcutaneous injection (sc) in a dosage of 110 mg (1.0 mL) every 4 weeks for a total of six doses.	

Primary: Categorized Percent Reduction In Daily Oral Corticosteroid (OCS) Dose During Weeks 20-24 As Compared to the Optimized Dose At Baseline

End point title	Categorized Percent Reduction In Daily Oral Corticosteroid (OCS) Dose During Weeks 20-24 As Compared to the Optimized Dose At Baseline
End point description:	
The primary endpoint was the 5-level categorized percent reduction in OCS dose during weeks 20 to 24 compared with the optimized dose at baseline. The primary analysis incorporated data from all randomized patients. Analysis of the primary and secondary variables related to categorical OCS dose reduction incorporated missing data as non-responders.	
No decrease indicates there was no decrease in OCS, loss of baseline asthma control during weeks 20 to 24, or discontinuation from study drug.

-----------------	----------------------------------

End point description:

An adverse event was defined in the protocol as any untoward medical occurrence that develops or worsens in severity during the conduct of a clinical study and does not necessarily have a causal relationship to the study drug. Relation of AE to treatment was determined by the investigator. Serious AEs include death, a life-threatening adverse event, inpatient hospitalization or prolongation of existing hospitalization, persistent or significant disability or incapacity, a congenital anomaly or birth defect, OR an important medical event that jeopardized the patient and required medical intervention to prevent the previously listed serious outcomes. Treatment-related adverse events or adverse events related to OCS use included events with missing relationship to study drug or OCS use, respectively.

End point type	Secondary
----------------	-----------

End point timeframe:

Day 1 up to Week 24 (end of treatment visit); Data were included between Day 1 and Week 24 for completed patients, and Day 1 and 4 weeks after the last dose of study drug for patients who discontinued treatment early.

Secondary: Percent Change from Baseline in Daily Oral Corticosteroid (OCS) Dose During Weeks 20-24 Using a Mixed Model for Repeated Measures

End point title	Percent Change from Baseline in Daily Oral Corticosteroid (OCS) Dose During Weeks 20-24 Using a Mixed Model for Repeated Measures
-----------------	---

End point description:

The baseline OCS dose is the prescribed optimized OCS dose following the OCS optimization period. Endpoint data are presented using an on-treatment approach. In this context, 'endpoint' was defined as the last observation obtained at a scheduled or qualified early termination visit during the treatment period. Weeks 20-24 data is included between the Week 20 dose and Week 24 for completed patients; last dose of study drug to 4 weeks after the last dose of study drug for patients who discontinued treatment early. Measurements collected outside of these defined timeframes are excluded from the analyses.

The mixed model repeated measures (MMRM) included fixed effects for treatment, visit, treatment by visit interaction, age group, and OCS dose group, duration of OCS use and baseline value as covariates, and patient as a random effect. Unstructured covariance was assumed for the repeated measures.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
27 January 2016	<p>Amendment 1 to the protocol was issued after 2 patients had been enrolled in the study under the original protocol.</p> <ul style="list-style-type: none">• The wording for adverse drug reactions, malignancy risk, pregnancy, immunogenicity, and risks of reslizumab was updated based on the most recent data.• The population to be studied was updated to clarify the exclusion of pediatric patients in the Netherlands.• Other pre-specified efficacy endpoints were updated to accommodate inhaled rescue medications other than SABA.• The number of nighttime awakenings due to asthma was updated to make this endpoint more general.• Other pre-specified efficacy measures and time points were revised to clarify that the asthma control diary will measure asthma symptoms, reliever bronchodilator inhalation use, and nighttime awakenings due to asthma on a daily basis.• The table of study procedures and assessments was updated for clarity.• Time of study drug administration was updated because the exact hour is not critical; the study drug is an anti inflammatory drug with a long half-life.• Procedures/assessments to be performed during and after administration of study drug were updated to capture events that occurred during or after study drug administration.• Inclusion criteria were updated to encompass the medium (and higher) daily dose range for a given ICS formulation.• Section 4.5.1 (Discontinuation of Study Treatment) and Section 4.5.2 (Complete Withdrawal from Study) were inserted to clarify discontinuation of study treatment and complete withdrawal from the study.• Section 7.1.7.3.1 (Anaphylaxis/Hypersensitivity Reactions CRF) and Section 7.1.7.3.2 (Creatine Phosphokinase/Muscular Adverse Events CRF) were added to address the reporting of anaphylaxis/hypersensitivity and muscular adverse events, respectively.• An additional blood sample collection to measure serum reslizumab concentrations was added for patients who experienced a serious adverse event... others.....

18 July 2016	<p>Amendment 2 to the protocol was issued after 44 patients had been enrolled in the study. Changes to the protocol were considered to have no negative impact on the safety of patients already enrolled in the study.</p> <ul style="list-style-type: none"> • The text for OCS medication in run-in period and eligibility criteria with respect to asthma control was revised. • Information regarding the natural rubber component of the prefilled syringe was added for transparency. • Stopping rules and discontinuation criteria were revised with regard to pregnancy, specifying that the administration of study drug should be discontinued, but the patient does not need to be withdrawn from the study for being pregnant. • Additional language was added to describe reasons for patient withdrawal. • Time points for CPK assessments were added at weeks 4, 8, 16, and 20 to address requests from the Health Authorities. • The inclusion criteria were revised to encompass the medium (and higher) daily dose range for a given ICS formulation (as per GINA 2015). • The schedule of assessments was updated. • Total blood volume was increased to account for additional CPK draws. • Text was added for the reporting of the disease under study as an adverse event. • Serious adverse event definition was updated for alignment between protocol language, adverse event reporting instructions, and processes. • A list of opportunistic infections was included in the protocol to aid in the accurate reporting of potential opportunistic infection adverse events. • Text for CPK/muscular adverse events CSR was updated per request of Health Authority and for overall clarity. • Immunogenicity analysis was updated to accommodate baseline ADA testing in previous placebo patients. • Appendix I (Opportunistic Infections) was added per request of Health Authority
