Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	08 July 2020
Is this the analysis of the primary completion data?	Yes
Primary completion date	04 June 2018
Global end of trial reached?	Yes
Global end of trial date	04 June 2018
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The primary objective of this study is to evaluate the safety and tolerability of 800 mg PBI-4050 (the Investigational Medicinal Product), administered orally once daily for 24 weeks, in subjects with Alström Syndrome.

Protection of trial subjects:

A Data Safety Monitoring Board (DSMB) reviewed individual subject safety data in an ongoing fashion during the course of the study, including safety data collected during the 36- or 48-week Extension Period (EP). When 8 subjects completed 1 month of study drug treatment, the DSMB met formally and determined, based on the adverse event profile, whether the study should be stopped or continued with either the current 800 mg dose of PBI-4050 or a reduced dose of 400 mg. The DSMB also determined if the safety data continued to support an additional 36 or 48 weeks of study drug treatment.

Background therapy:

Subjects were allowed to continue their individual current therapy during the study, with dose adjustments (if deemed necessary by the Investigator) documented in the subjects' medical records and in the electronic case report form.

Evidence for comparator:

This was an uncontrolled study with all subjects receiving the same dose and frequency of PBI-4050 (800 mg/day for up to 72 weeks).

Actual start date of recruitment	22 February 2016
Long term follow-up planned	Yes
Long term follow-up rationale	Safety, Efficacy, Ethical reason, Regulatory reason, Scientific research
Long term follow-up duration	3 Years
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	United Kingdom: 12
Worldwide total number of subjects	12
EEA total number of subjects	12

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0

Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	1
Adults (18-64 years)	11
From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

This was a single-center study conducted at a specialized Alström syndrome (ALMS) center in the United Kingdom (Queen Elizabeth Hospital in Birmingham).

Pre-assignment

Screening details:

15 subjects were screened from 22 February 2016 to 04 June 2018, with 3 subjects not meeting eligibility criteria (i.e., screen failures).

Period 1

Period 1 title	Overall Trial (overall period)
Is this the baseline period?	Yes
Allocation method	Not applicable
Blinding used	Not blinded

Arms

Arm title	800 mg PBI-4050
-----------	-----------------

Arm description:

Each daily oral dose of 800 mg PBI-4050 consisted of 4 × 200 mg gel capsules taken once daily at approximately the same time each day with a glass of water, at least 1 hour before or 2 hours after a meal for 24 weeks (main study) and, if consented, for up to an additional 36 or 48 weeks in the extension period.

Arm type	Experimental
Investigational medicinal product name	Fezagepras
Investigational medicinal product code	PBI-4050
Other name	
Pharmaceutical forms	Capsule, soft
Routes of administration	Oral use

Dosage and administration details:

Each daily oral dose of 800 mg PBI-4050 consisted of 4 × 200 mg gel capsules taken once daily approximately at the same time each day with a glass of water, at least 1 hour before or 2 hours after a meal for 24 weeks (main study) and, if consented, for up to an additional 36 or 48 weeks in an Extension Period.

Number of subjects in period 1	800 mg PBI-4050
Started	12
Completed	12

Baseline characteristics

Reporting groups

Reporting group title	Overall Trial (overall period)
Reporting group description:	
The Safety Population included all subjects who signed an informed consent form and received at least 1 dose of PBI4050.	

Reporting group values	Overall Trial (overall period)	Total	
Number of subjects	12	12	
Age categorical Units: Subjects			
In utero	0	0	
Preterm newborn infants (gestational age < 37 wks)	0	0	
Newborns (0-27 days)	0	0	
Infants and toddlers (28 days-23 months)	0	0	
Children (2-11 years)	0	0	
Adolescents (12-17 years)	1	1	
Adults (18-64 years)	11	11	
From 65-84 years	0	0	
85 years and over	0	0	
Age continuous Units: years			
arithmetic mean	26.1		
standard deviation	± 9.56	-	
Gender categorical Units: Subjects			
Female	4	4	
Male	8	8	
Duration of ALMS			
ALMS duration was measured from the diagnosis date to the informed consent form date.			
Units: Years			
arithmetic mean	10.8		
standard deviation	± 5.92	-

Primary: Safety and Tolerability

End point title	Safety and Tolerability ^[1]
End point description: Number of subjects with at least 1 of the following events: treatment-emergent adverse event (TEAE) or treatment-emergent serious adverse event (TESAE); study drug related TEAE/TESAE (TEAEs/TESAEs assessed as possibly, probably, or definitely related to study drug); TEAE leading to permanent discontinuation of study; TEAE leading to death; protocol-defined hypoglycemia; clinically significant clinical laboratory tests; ECG; vital signs; physical examination.	
End point type	Primary

End point timeframe:

Week 1 (after first dose of study drug) to Week 72

Notes:

[1] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: This study was exploratory and aimed to evaluate the safety and tolerability of PBI-4050 and its effects on biomarkers. The study collected data to derive descriptive statistics on secondary endpoints for future studies but no statistical hypotheses were tested. Therefore, a minimum of 8 subjects was deemed necessary for this study.

Adverse events

Adverse events information

Timeframe for reporting adverse events:

Day -44 to the end of the study visit

Adverse event reporting additional description:

The condition of the subject was monitored throughout the study. At each visit and during each weekly telephone contact, study personnel reviewed the subject diary card and elicited adverse events (AEs) from each subject using a standard, non-leading question, such as "How have you been since the last visit/during the previous study period?"

Assessment type	Systematic

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
17 March 2016	Substantial changes were: 1) The objective related to the hyperinsulinaemic-euglycaemic clamp was moved from a secondary to an exploratory objective; 2) The 4-point and 7-point glucose profiles were removed as secondary endpoints, as they were not sensitive enough to detect potential effects; 3) Adequate contraception was required for females of childbearing potential who were sexually active with a non-sterile male partner; 4) Discontinuation criteria related to dropping heart rate and systolic blood pressure were clarified to be accompanied by symptoms; 5) Storage condition of study drug was changed for consistency with the study drug label and EU labeling for solid dosage forms; 6) Laboratory tests for FPG and fasting insulin were removed from the Week 4, 8, 16, and 20 visits; and 7) Provision was added to allow the Investigator's discretion on the performance of the hyperinsulinemic-euglycemic clamp procedure for certain subjects if appropriate.
22 August 2016	Substantial changes were: 1) A 36-week Extension Period (EP) was added to capture longer term safety and exploratory efficacy data of PBI-4050 in subjects with ALMS; 2) The time period to collect historical data relevant to the disease course was extended from 3 to 10 years; 3) The Data Safety Monitoring Board reviewed individual safety data during the 36-week EP and determined if the safety data supported an additional 36 weeks of study drug treatment; 4) Glycated hemoglobin was performed at every visit during the initial 24 weeks of study drug treatment to capture more data; 5) Exclusion criterion 10 was added to exclude subjects who had a history of an allergic reaction to PBI-4050 or any of its excipients; 6) Based on the addition of a 36-week EP, the primary analysis was to be conducted after the initial 24 weeks of study drug treatment and a final analysis was to be completed at the end of the EP; 7) Subjects were required to give informed consent in order to enter into the 36-week EP; 8) According to the Investigator's Brochure, organic anion transporter (OAT) inhibition could lead to a clinically relevant drug interaction at efficacious human exposures of PBI-4050 based on in vitro inhibitory potency. Therefore, concomitant use of substrates for OAT1 and OAT3 was to be avoided or Investigators were to closely monitor the subject for possible dose adjustments of concomitant substrates for OAT1 and OAT3; 9) Subjects who had already stopped study drug at Week 24 and completed an End of Study (EoS) visit recommenced capture of concomitant therapy at the Start of Extension Study visit; 10) Subjects who had stopped study drug and completed an EoS visit and wanted to continue treatment in the EP were required to meet inclusion and exclusion criteria in order to be treated during the EP; and 11) Secondary and exploratory biomarkers of glucose metabolism were only analyzed at visits that the subject was required to attend fasted.

09 December 2016	Substantial changes were: 1) Added 12 weeks to the 36-week Extension Period (EP) to allow subjects who completed the 36-week EP to continue study drug treatment without a break until the rollover study was open for enrolment (i.e., approved and initiated); 2) A Data Safety Monitoring Board continued to review individual subject safety data through the EP, regardless of whether it was 36- or 48-weeks in duration; 3) Clarified that subjects who entered the EP at Week 24 signed informed consent; 4) Liver and cardiac magnetic resonance imaging scans were removed from the EP Week 12 and EP Week 24 visits to reduce subjects' burden and radiological exposure in the study; 5) Subjects who completed study drug treatment through the EP Week 48 visit were eligible to enter a rollover study in order to continue ongoing study drug without any break in treatment; 6) Removed Inclusion Criterion #6 restricting subjects who had a body mass index of at least 25 kg/m2 to broaden the subject population; 7) Revised Exclusion Criterion #6 to add use of any moderate/potent inducer or inhibitor of cytochrome P450 (CYP) 2C9 isozyme, based on preclinical data showing that CYP2C9 is the major isoform responsible for the metabolism of PBI-4050 and that co-administration of drugs known to be inducers or inhibitors of CYP2C9 could alter the rate of metabolic clearance of PBI 4050; 8) Added telephone contacts for subjects who could not enroll in the rollover study because it was not open for enrolment and for subjects who completed the 48-week EP but chose not to enter the rollover study; and 9) Since subjects could enroll in a rollover study at either the EP Week 36 or EP Week 48 visit without completing the End of Study visit, the defined end of the study was changed to the final visit of the final subject in the study.
