

Clinical trial results:

A 24-week International, Multicenter, Randomized, Open-Label, Active-Controlled, Parallel Group, Phase 3b Trial with a 28-week Extension to Evaluate the Efficacy and Safety of Saxagliptin Co-administered with Dapagliflozin Compared to Insulin Glargine in Subjects with Type 2 Diabetes who have Inadequate Glycemic Control on Metformin with or without Sulfonylurea Therapy

Summary

EudraCT number	2015-001702-33
Trial protocol	HU CZ ES SE DK DE
Global end of trial date	10 November 2017

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	10 November 2017
Is this the analysis of the primary completion data?	Yes
Primary completion date	08 May 2017
Global end of trial reached?	Yes
Global end of trial date	10 November 2017
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The primary objective of this trial was to examine whether the mean change from baseline in hemoglobin A1c (HbA1c) with co-administered saxagliptin 5 milligrams (mg) once daily (QD) and dapagliflozin 10 mg QD plus metformin with or without sulfonylurea (SU) is noninferior to titrated insulin glargine plus metformin with or without SU after 24 weeks of open-label treatment.

Protection of trial subjects:

This study was performed in accordance with the ethical principles that have their origin in the Declaration of Helsinki and that are consistent with International Council for Harmonisation/Good Clinical Practice, applicable regulatory requirements, and the AstraZeneca policy on Bioethics.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	20 October 2015
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

From 65 to 84 years	118
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

This study was conducted at 112 centers in 11 countries from 20 Oct 2015 to 10 Nov 2017. There were 2 data cut-offs for this study: 8 May 2017 for analyses of the short-term study period (after 24 weeks of open-label treatment) and 10 Nov 2017 for analyses of the short-term plus long-term study period (after 52 weeks of open-label treatment).

Pre-assignment

Screening details:

The study duration was up to 56 weeks, consisting of a 2-week screening period, 2-week lead-in period, 24-week short-term treatment period, and 28-week long-term treatment period.

Pre-assignment period milestones

Number of subjects started	650 ^[1]
Number of subjects completed	643

Pre-assignment subject non-completion reasons

Reason: Number of subjects	Did not receive randomised treatment: 7
----------------------------	---

Notes:

[1] - The number of subjects reported to have started the pre-assignment period are not the same as the worldwide number enrolled in the trial. It is expected that these numbers will be the same.

Justification: 650 subjects were randomized overall, and number Started for Pre-assignment period reflects this value. A total of 7 of the 650 randomized subjects did not receive treatment. The randomized subject data set consisted of all randomized subjects who received at least 1 dose of study medication and therefore number in this subject population was 643. Demographic characteristics, including subject enrollment per country, was summarized for the randomized subject data set (ie, 643).

Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
Arm title	Dapagliflozin + Saxagliptin + Metformin

Arm description:

Subjects received dapagliflozin 10 mg and saxagliptin 5 mg, administered orally QD in the morning for the 52-week treatment period (24-week short-term period and 28-week long term period).

Subjects continued to receive their stable dose of metformin with or without SU throughout the study.

Arm type	Experimental
Investigational medicinal product name	Dapagliflozin
Investigational medicinal product code	
Other name	Farxiga, BMS-512148
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

Dapagliflozin 10 mg tablets were administered orally QD in the morning for the 52-week treatment period.

Investigational medicinal product name	Saxagliptin
Investigational medicinal product code	
Other name	Onglyza
Pharmaceutical forms	Tablet

Routes of administration	Oral use
Dosage and administration details:	
Saxagliptin 5 mg tablets were administered orally QD in the morning for the 52-week treatment period.	
Investigational medicinal product name	Metformin
Investigational medicinal product code	
Other name	Glucophage XR
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

Metformin 500 mg tablets were administered orally per investigator discretion at a dose of no less than 1500 mg per day and not to exceed 2500 mg per day (or maximum locally approved dose) based on the subject's qualifying dose at screening.

Arm title	Titrated Insulin + Metformin
------------------	------------------------------

Arm description:

Subjects were to administer insulin glargine subcutaneously QD at the same time every day for the 52-week treatment period (24-week short-term period and 28-week long term period), following investigator instructions and training. All subjects started with an initial dose of 0.2 units/kg body weight or at least 10 units of insulin per day. Subjects self-titrated the dose of insulin glargine over the first 8 weeks of the study based on daily glucose monitoring. The investigator had the discretion to modify insulin dose based on his/her assessment between Week 8 and Week 12 with the goal to reach an acceptable and stable insulin dose by Week 12.

Subjects continued to receive their stable dose of metformin with or without SU throughout the study.

Arm type	Active comparator
Investigational medicinal product name	Insulin glargine
Investigational medicinal product code	
Other name	Lantus
Pharmaceutical forms	Solution for injection in pre-filled pen
Routes of administration	Subcutaneous use

Dosage and administration details:

All subjects started with an initial dose of 0.2 units/kilogram (kg) body weight or at least 10 units of insulin per day. Subjects self-titrated the dose of insulin glargine over the first 8 weeks of the study based on daily glucose monitoring. Insulin was administered as 100 units/millilitre solution for injection.

Investigational medicinal product name	Metformin
Investigational medicinal product code	
Other name	Glucophage XR
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

Metformin 500 mg tablets were administered orally per investigator discretion at a dose of no less than 1500 mg per day and not to exceed 2500 mg per day (or maximum locally approved dose) based on the subject's qualifying dose at screening.

Number of subjects in period 1	Dapagliflozin + Saxagliptin + Metformin	Titrated Insulin + Metformin
Started	324	319
Entered long-term study	306	294
Received treatment in long-term study	295 ^[2]	284 ^[3]
Completed	296	287
Not completed	28	32

Reason not reported	10	4
Pregnancy	-	1
Did not enter long-term study	18	25
Lost to follow-up	-	2

Notes:

[2] - The number of subjects at this milestone seems inconsistent with the number of subjects in the arm. It is expected that the number of subjects will be greater than, or equal to the number that completed, minus those who left.

Justification: Started = subjects randomized to Dapagliflozin + Saxagliptin + Metformin arm who received treatment in short-term study (324). Intermediate milestones: subjects entering long-term study (306) and subjects receiving treatment in long-term study (295). Completed = subjects completing long-term study (296). Since Started - Completed = Not Completed and Subject Disposition is presented for the overall study, those subjects not entering the long-term study (18) are indicated as non-completers.

[3] - The number of subjects at this milestone seems inconsistent with the number of subjects in the arm. It is expected that the number of subjects will be greater than, or equal to the number that completed, minus those who left.

Justification: Started = subjects randomized to Dapagliflozin + Saxagliptin + Metformin arm who received treatment in short-term study (319). Intermediate milestones: subjects entering long-term study (294) and subjects receiving treatment in long-term study (284). Completed = subjects completing long-term study (287). Since Started - Completed = Not Completed and Subject Disposition is presented for the overall study, those subjects not entering the long-term study (25) are indicated as non-completers.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
17 March 2016	Addition of discontinuation guidelines due to ketoacidosis, clarification of starting insulin dose to 0.2 units/kg body weight or at least 10 units of insulin per day and addition of language describing investigator modification of insulin-dose titration, and removal of details about discontinuation due to hypoglycemia during the lead-in period.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
