#### Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	Yes

Notes:

## Results analysis stage

Analysis stage	Final
Date of interim/final analysis	23 January 2019
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	20 December 2018
Was the trial ended prematurely?	No

Notes:

## General information about the trial

Main objective of the trial:

To compare the efficacy of a new formulation of insulin glargine (HOE901-U300) to Lantus in terms of change of HbA1c from baseline to endpoint (month 6) in children and adolescents with type 1 diabetes mellitus.

Protection of trial subjects:

Subjects were fully informed of all pertinent aspects of the clinical trial as well as the possibility to discontinue at any time in language and terms appropriate for the subject and considering the local culture. During the course of the trial, subjects were provided with individual subject cards indicating the nature of the trial the subject is participating, contact details and any information needed in the event of a medical emergency. Collected personal data and human biological samples were processed in compliance with the Sanofi-Aventis Group Personal Data Protection Charter ensuring that the Group abides by the laws governing personal data protection in force in all countries in which it operates.

Background therapy:

Fast acting mealtime insulin analogs were required to be used 6 months prior screening visit. The type of insulin were to remain unchanged during the study.

Evidence for comparator: -

Actual start date of recruitment	14 April 2016
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

## Population of trial subjects

### Subjects enrolled per country

Country: Number of subjects enrolled	Argentina: 31
Country: Number of subjects enrolled	Brazil: 27
Country: Number of subjects enrolled	Canada: 21
Country: Number of subjects enrolled	Chile: 22

Worldwide total number of subjects	463
EEA total number of subjects	192

Notes:

<b>Subjects enrolled per age group</b>	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	143
Adolescents (12-17 years)	320
Adults (18-64 years)	0
From 65 to 84 years	0
85 years and over	0

## Subject disposition

### Recruitment

Recruitment details:

The study was conducted at 105 centers in 24 countries. A total of 616 subjects were screened between 14 April 2016 and 31 October 2017, of which 153 were screen failures. Screen failures were mainly due to glycated hemoglobin (HbA1c) level outside of defined ranges per eligibility criteria.

### Pre-assignment

Screening details:

A total of 463 subjects were randomized in the study. Randomization was stratified by age group (<12 years and ≥12 years) and by HbA1c (<8.5% and ≥8.5%). Assignment to arms was done centrally using interactive voice system in 1:1 ratio.

### Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Not blinded

### Arms

Are arms mutually exclusive?	Yes
<b>Arm title</b>	HOE901-U300

Arm description:

Insulin glargine 300 Units/milliliter (U/mL) Subcutaneous (SC) injection once daily in the morning or evening for 12 months.

Arm type	Experimental
Investigational medicinal product name	Insulin glargine
Investigational medicinal product code	
Other name	Toujeo
Pharmaceutical forms	Injection
Routes of administration	Subcutaneous use

Dosage and administration details:

Insulin glargine 300 U/mL SC injection using a prefilled pen. Dose titration to achieve fasting self-monitored plasma glucose (SMPG) from 90 to 130 milligram/deciliter (mg/dL) (5.0 to 7.2 millimol per liter [mmol/L]).

<b>Arm title</b>	Lantus
------------------	--------

Arm description:

Insulin glargine 100 U/mL SC injection once daily in the morning or evening for 12 months.

Arm type	Experimental
Investigational medicinal product name	Insulin glargine
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Injection
Routes of administration	Subcutaneous use

Dosage and administration details:

Insulin glargine 100 U/mL SC injection using a prefilled pen. Dose titration to achieve fasting SMPG from 90 to 130 mg/dL (5.0 to 7.2 mmol/L).

<b>Number of subjects in period 1</b>	HOE901-U300	Lantus
Started	233	230
Completed	217	207
Not completed	16	23
Adverse Event	3	3
Randomized and not treated	-	2
Other than specified	5	11
Poor compliance to protocol	7	7
Lack of efficacy	1	-

## Baseline characteristics

### Reporting groups

standard deviation	± 0.88	± 0.87	-

## End points

### End points reporting groups

Reporting group title	HOE901-U300
Reporting group description: Insulin glargine 300 Units/milliliter (U/mL) Subcutaneous (SC) injection once daily in the morning or evening for 12 months.	
Reporting group title	Lantus
Reporting group description: Insulin glargine 100 U/mL SC injection once daily in the morning or evening for 12 months.	

### Primary: Change From Baseline in HbA1c to Month 6

End point title	Change From Baseline in HbA1c to Month 6
End point description: Change in HbA1c was calculated by subtracting baseline value from Month 6 value. Adjusted least-square (LS) means and standard errors (SE) were obtained using analysis of covariance (ANCOVA) after multiple imputations of missing data using post-baseline HbA1c data available on the main 6-month randomized period. Analysis was performed on intent-to-treat (ITT) population that included all randomized subjects, regardless of whether the treatment kit was used, and was analysed according to the allocated treatment group. Here, number of subjects analysed signified number of subjects with available data for the endpoint.	
End point type	Primary
End point timeframe: Baseline to Month 6	

End point values	HOE901-U300	Lantus		
Subject group type	Reporting group	Reporting group		
Number of subjects analysed	232	230		
Units: Percentage of HbA1c				
arithmetic mean (standard deviation)	-0.399 ( $\pm$ 0.063)	-0.402 ( $\pm$ 0.064)		

### Statistical analyses

Statistical analysis title	HOE901-U300, Lantus
Statistical analysis description: Analysis was performed using ANCOVA models which included the treatment group, the randomization stratum of age group at screening visit (<12 years and $\geq$ 12 years), and the continuous fixed covariates of the baseline HbA1c value.	
Comparison groups	HOE901-U300 v Lantus

Number of subjects included in analysis	462
Analysis specification	Pre-specified
Analysis type	non-inferiority <sup>[1]</sup>
Parameter estimate	LS Mean difference
Point estimate	0.004
Confidence interval	
level	95 %
sides	2-sided
lower limit	-0.172
upper limit	0.179
Variability estimate	Standard error of the mean
Dispersion value	0.09

Notes:

[1] - Non-inferiority of HOE901-U300 versus Lantus was demonstrated if the upper bound of the two-sided 95% confidence interval (CI) for the difference in the mean change in HbA1c from baseline to month 6 was <0.3%.

<b>Statistical analysis title</b>	HOE901-U300, Lantus
-----------------------------------	---------------------

Statistical analysis description:

A step-wise closed testing approach was used to control the type I error. Analysis was performed using ANCOVA models which included the treatment group, the randomization stratum of age group at screening visit (<12 years and ≥12 years), and the continuous fixed covariates of the baseline HbA1c value.

Comparison groups	HOE901-U300 v Lantus
Number of subjects included in analysis	462
Analysis specification	Pre-specified
Analysis type	superiority <sup>[2]</sup>
P-value	= 0.965 <sup>[3]</sup>
Method	ANCOVA

Notes:

[2] - Superiority of HOE901-U300 versus Lantus was demonstrated if the upper bound of the two-sided 95% CI for the difference between treatment groups was <0 (zero).

[3] - Threshold for significance at 0.025 level.

## Secondary: Change From Baseline in Fasting Plasma Glucose (FPG) to Month 6

End point title	Change From Baseline in Fasting Plasma Glucose (FPG) to Month 6
-----------------	---

End point description:

Change in FPG was calculated by subtracting baseline value from Month 6 value. Adjusted LS means and SE were obtained using ANCOVA after multiple imputation to address missing data in the main 6 month randomized period. Analysis was performed on ITT population. Here, number of subjects analysed signified number of subjects with available data for the endpoint.

## Adverse events

### Adverse events information

Timeframe for reporting adverse events:

All Adverse Events (AEs) were collected from signature of the informed consent form until the end of the study (Week 58) regardless of seriousness or relationship to investigational product.

Adverse event reporting additional description:

Reported AEs and deaths are treatment-emergent adverse events that is AEs that developed, worsened or became serious during the 'on treatment period' (time from first dose of IMP up to 2 days after last injection of IMP). Analysis was performed on safety population.

## More information

### Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
29 January 2016	Following protocol changes were implemented before the study was initiated. <ul style="list-style-type: none"><li>- Primary and secondary efficacy analyses were modified to include all post-baseline data regardless of treatment discontinuation.</li><li>- Change to the minimum rate of subjects to be randomized from the age range &lt; 12 years.</li><li>- Standard deviation assumption for sample size determination was modified.</li><li>- Removal of sampling for hematology and clinical chemistry at baseline visit.</li><li>- Change to the dose adjustment rules of the IMP to provide more structured guidance for adjustment of the IMP dose.</li><li>- Change to the prohibited concomitant therapy by clarifying that short-term use of non-study antihyperglycemic agents other than the IMP or non-investigational medicinal product (NIMP) was not considered as a prohibited therapy and that use of prohibited therapy would result in the subject's withdrawal from the study treatment rather than from the study.</li><li>- Change specifying the descriptive purpose of secondary efficacy analyses.</li></ul>
23 August 2016	Following protocol changes were made: <ul style="list-style-type: none"><li>- Change to statistical methodology in primary and secondary endpoint analyses was made to replace the the mixed-effect model with repeated measures (MMRM) by a multiple imputation approach.</li><li>- Change in eligibility criteria to lift the upper limit of the HbA1c range from 10% to 11%.</li><li>- Change to instructions for hyperglycemia with ketosis.</li><li>- Change to instructions for glucose meter by providing recommendations for tests with the control solution.</li><li>- Change to instructions for handling of subjects after permanent treatment discontinuation by highlighting importance of collecting key parameters at scheduled study endpoint.</li><li>- Change to utilization of Pharmacokinetic data by removing objective of comparison with historical data in adults.</li></ul>

Notes:

### Interruptions (globally)

Were there any global interruptions to the trial? No

### Limitations and caveats

None reported
