Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	11 August 2017
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	11 August 2017
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The primary objective of this study was to determine the response to a 144-hour (6-day) continuous intravenous (IV) infusion of SAGE-547 Injection (hereafter referred to as 'SAGE-547') compared to placebo administered to support the weaning of all continuous third-line agents in adult and paediatric subjects with super-refractory status epilepticus (SRSE), and for the response to endure at least 24 hours after cessation of the SAGE-547 or placebo infusion (primary response). Status epilepticus (SE) is a life-threatening condition that involves persistent or recurring seizures. SRSE is a severe form of SE that continues or recurs despite 24 hours or more of anesthetic third-line agents. Subjects with SRSE, who were admitted to the intensive care unit (ICU) and placed into a medically-induced coma, were included in the study. All subjects were critically ill due to a variety of comorbid conditions and had been in status epilepticus for a mean of 17.6 days prior to receiving study drug.

Protection of trial subjects:

This study was conducted in accordance with applicable International Conference on Harmonisation (ICH) and Good Clinical Practice (GCP) guidelines, as well as local regulations. Because most study subjects were in a state of coma, prior consent was given by a legally authorised representative. Some subjects were able to re-consent upon awakening from the coma.

Background therapy:

Third-line anti-seizure medication and medically induced coma.

Evidence for comparator: -

Actual start date of recruitment	31 July 2015
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Spain: 2
Country: Number of subjects enrolled	United Kingdom: 2
Country: Number of subjects enrolled	Austria: 1
Country: Number of subjects enrolled	Denmark: 2
Country: Number of subjects enrolled	Estonia: 1
Country: Number of subjects enrolled	Finland: 3
Country: Number of subjects enrolled	France: 3
Country: Number of subjects enrolled	Italy: 9
Country: Number of subjects enrolled	Canada: 4
Country: Number of subjects enrolled	United States: 101
Country: Number of subjects enrolled	Israel: 2
Country: Number of subjects enrolled	Serbia: 2

Worldwide total number of subjects	132
EEA total number of subjects	23

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	15
Adolescents (12-17 years)	11
Adults (18-64 years)	81
From 65 to 84 years	23
85 years and over	2

Subject disposition

Recruitment

Recruitment details:

Subjects took part in the study at 122 investigative sites in Canada, United States, Austria, Denmark, Estonia, Finland, France, Germany, Israel, Italy, Serbia, Spain and the United Kingdom from 31 July 2015 to 11 August 2017. Note: The "Subjects Enrolled By Country" table in the "Trial Information" section reflects randomised subjects.

Pre-assignment

Screening details:

Subjects 2 years of age and older with super-refractory status epilepticus (SRSE) were eligible. The subject population was characterised by having underlying medical conditions, in addition to severe and complex SRSE, with ongoing treatment in a hospital intensive care unit (ICU), and in a medically induced coma.

Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Monitor, Carer

Arms

Are arms mutually exclusive?	No
Arm title	Placebo

Arm description:

Subjects randomised to placebo received a continuous IV infusion of matching placebo, prepared and administered identically to SAGE-547. Subjects who failed to achieve treatment success during the blinded infusion or within 24 hours of completion of the blinded infusion were potentially eligible to receive open-label SAGE-547 at a higher dose (maximum dose 150 ug/kg/hr).

Arm type	Placebo
Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Concentrate for solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

Subjects randomised to placebo received a continuous IV infusion of matching placebo, prepared and administered identically to SAGE-547. Subjects who failed to achieve treatment success during the blinded infusion or within 24 hours of completion of the blinded infusion were potentially eligible to receive open-label SAGE-547 at a higher dose (maximum dose 150 ug/kg/hr).

Arm title	SAGE-547
------------------	----------

Arm description:

Subjects randomized to SAGE-547 received a continuous IV infusion of SAGE-547 Injection 5 mg/mL for 144 hours. The dose regimen included a 1-hour loading infusion of 300 ug/kg/hr (0-1 hour), then 90 ug/kg/hr (2 to 120 hours), followed by a taper to 65 ug/kg/hr (121 to 128 hours), 45 ug/kg/hr (129 to 136 hours), and 25 ug/kg/hr (137 to 144 hrs). Subjects who failed to achieve treatment success during the blinded infusion or within 24 hours of completion of the blinded infusion were potentially eligible to receive open-label SAGE-547 at a higher dose (maximum dose 150 ug/kg/hr).

Arm type	Experimental
Investigational medicinal product name	SAGE-547
Investigational medicinal product code	
Other name	Brexanolone
Pharmaceutical forms	Concentrate for solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

Subjects randomized to SAGE-547 received a continuous IV infusion of SAGE-547 Injection 5 mg/mL for 144 hours. The dose regimen included a 1-hour loading infusion of 300 ug/kg/hr (0-1 hour), then 90 ug/kg/hr (2 to 120 hours), followed by a taper to 65 ug/kg/hr (121 to 128 hours), 45 ug/kg/hr (129 to 136 hours), and 25 ug/kg/hr (137 to 144 hrs). Subjects who failed to achieve treatment success during the blinded infusion or within 24 hours of completion of the blinded infusion were potentially eligible to receive open-label SAGE-547 at a higher dose (maximum dose 150 ug/kg/hr).

Number of subjects in period 1[1]	Placebo	SAGE-547
Started	66	66
Intent-to-Treat Analysis Set	66	66
Completed	50	53
Not completed	16	14
Adverse Event	1	1
Subject erroneously received SAGE-547	1	-
Death	11	11
Left Study Site for Rehabilitation	-	1
Transferred Away from Study Site	1	-
Completed Visits but Discontinued Drug	2	1
Joined	0	1
Transferred in from other group/arm	-	1

Notes:

[1] - The number of subjects transferring in and out of the arms in the period are not the same. It is expected the net number of transfers in and out of the arms in a period, will be zero.

Justification: The reported data are valid.

Baseline characteristics

Reporting groups^[1]

Reporting group title	Overall Study
-----------------------	---------------

Reporting group description: -

Notes:

[1] - The number of subjects reported to be in the baseline period is not equal to the worldwide number of subjects enrolled in the trial. It is expected that these numbers will be the same.

Justification: The reported data are valid.

Reporting group values	Overall Study	Total	
Number of subjects	132	132	
Age categorical			
Units: Subjects			

Age continuous			
The Safety Analysis Set included all subjects who had an infusion of blinded study drug initiated. One subject randomised to placebo was erroneously given SAGE-547 and was, therefore, only included in the SAGE-547 group.			
Units: years			
arithmetic mean	39.6		
standard deviation	± 23.29	-	
Gender categorical			
The Safety Analysis Set included all subjects who had an infusion of blinded study drug initiated. One subject randomised to placebo was erroneously given SAGE-547 and was, therefore, only included in the SAGE-547 group.			
Units: Subjects			
Female	65	65	
Male	67	67	
Race			
The Safety Analysis Set included all subjects who had an infusion of blinded study drug initiated. One subject randomised to placebo was erroneously given SAGE-547 and was, therefore, only included in the SAGE-547 group.

Primary: Percentage of Subjects Able to be Weaned Off All Third-Line Agents Prior to End of Double-Blind SAGE-547 or Placebo Infusion, and Remain Off All Third-Line Agents for ≥ 24 Hours Following the End of SAGE-547 or Placebo Infusion

End point title	Percentage of Subjects Able to be Weaned Off All Third-Line Agents Prior to End of Double-Blind SAGE-547 or Placebo Infusion, and Remain Off All Third-Line Agents for ≥ 24 Hours Following the End of SAGE-547 or Placebo Infusion
End point description:	
Third-line agents (TLAs) were anaesthetic agents that were administered in order to reach a seizure or burst suppression electroencephalogram (EEG) pattern. For this study, third-line agents were defined as continuous intravenous infusions of pentobarbital/thiopental, midazolam, propofol, and ketamine at maintenance doses alone or in combination sufficient to produce a burst or seizure suppression pattern on the EEG. A responder was a subject who was able to be weaned off all third-line agents prior to the end of the SAGE-547 or placebo infusion and remain off all third-line agents for ≥ 24 hours after the end of the study drug infusion. The primary analysis was a comparison between SAGE-547 and placebo of the proportion of responders. The Intent-to-Treat Analysis Set included all subjects who had an infusion of blinded study drug initiated.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
27 May 2015	<ul style="list-style-type: none">• Added Europe to the list of regions with study sites• Added the requirement for maintenance of burst suppression for the first 12 hours of the study drug infusion• Increased the sample size from 126 to 140 (with the intent of obtaining 126 evaluable subjects)• Added that all subjects who failed to complete their randomised treatment infusion or did not have at least one attempt to wean off all TLAs during study treatment were considered "failures" for the primary endpoint• Established the Clinical Standardization Guidelines and Team to assist sites and create consistency with weaning practices across study sites• Added qualifying wean (QW) guidance• Added the collection of Health Economics and Outcome data for subjects who were discharged from intensive care unit (ICU) prior to completion of Visit 12/12R• Added the Status Epilepticus Severity Score assessment during Visit 1
28 October 2015	<ul style="list-style-type: none">• Removed paediatric subjects
17 November 2015	<ul style="list-style-type: none">• Increased the number of study sites to up to 180 sites• Revised the list of accepted TLAs to include thiopental 3 mg/kg/h• Extended the QW EEG for the blinded study drug infusion to cover the 24 hours after the end of TLAs in order to confirm that the QW was a success• Added the consent EEG and blinded infusion EEG to the EEG records to be read centrally to capture the depth of burst suppression prior to QW and during the first 12 hours of the blinded infusion
22 April 2016	Never implemented.
12 August 2016	<ul style="list-style-type: none">• Added Israel to the list of regions with study sites• Refined exclusion criteria, to exclude subjects who had been treated or randomised in this or any other SAGE-547 study with the intent of allowing subjects previously screened who subsequently met entry criteria• Provided additional guidance for TLA weaning• Extended the time frame from QW failure to when blinded infusion began to 8 hours• Removed an exclusion criterion 5 sub-bullet due to variations of interpretations of a "Do Not Resuscitate" order across sites• Removed the requirement for subjects to be in EEG burst suppression in the 24 hours prior to the QW

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
