

Clinical trial results:

Single dose, open label, uncontrolled, safety trial of intravenous administration of idarucizumab to paediatric patients enrolled from ongoing phase IIb/III clinical trials with dabigatran etexilate for the treatment and secondary prevention of venous thromboembolism.

Date of interim/final analysis	18 December 2019
Is this the analysis of the primary completion data?	Yes
Primary completion date	19 October 2019
Global end of trial reached?	Yes
Global end of trial date	19 October 2019
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

To demonstrate the safety of idarucizumab, as assessed by the occurrence of patients with drug related adverse events (including immune reactions) and all-cause mortality in paediatric venous thromboembolism (VTE) patients treated with dabigatran in ongoing clinical trials who require emergency surgery/urgent procedures or patients who have life-threatening or uncontrolled bleeding which requires urgent intervention, when rapid reversal of the anticoagulant effects of dabigatran is needed.

Protection of trial subjects:

Only subjects that met all the study inclusion and none of the exclusion criteria were to be entered in the study. All subjects were free to withdraw from the clinical trial at any time for any reason given. Close monitoring of all subjects was adhered to throughout the trial conduct. Rescue medication was allowed for all patients as required. The number 1 for age category 'In Utero' in trial population does not reflect the true age of this participant. The age information is not provide for protection of pediatric participant.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	30 March 2017
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Subject disposition

Recruitment

Recruitment details:

An open-label, uncontrolled case series trial, with a single treatment arm of idarucizumab in patients with venous thromboembolism treated with dabigatran etexilate in ongoing Boehringer Ingelheim pediatric clinical trials (1160.106 and 1160.108). Treatment period was around 1 day followed by 29 days of safety follow-up period.

Pre-assignment

Screening details:

All subjects were screened for eligibility to participants in the trial. Subjects attended specialist sites which would then ensure that they met all strictly implemented inclusion/exclusion criteria. Subjects were not to be assigned to treatment groups if any one of the specific entry criteria were violated.

Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Non-randomised - controlled
Blinding used	Not blinded

Arms

Arm title	Idarucizumab
-----------	--------------

Arm description:

2.5 gram (g) per 50 milliliter (mL) vial of Idarucizuma was administrated via intravenous injection (vial 1) with (in order of preference): a 5 minutes (min) infusion with an infusion pump, a 10 to 15 min drip, or intravenous push with a syringe followed by another injection (vial 2) of same dosage of Idarucizumab for participants who were treated with dabigatran and had uncontrolled or life threatening bleeding that required urgent medical or surgical intervention or who required emergency surgery/urgent procedures where adequate haemostasis was required (total dosage: up to 5g based on the weight of participant). Two equal injection parts were administered no more than 15 min apart. The time between start of injection of the first vial and end of the second vial was 22 min followed by 24 hours post-dose observation period.

Arm type	Experimental
Investigational medicinal product name	Idarucizumab
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection/infusion
Routes of administration	Intravenous use

Dosage and administration details:

2 injections of 2.5 gram (g) per 50 milliliter (mL) vial of Idarucizuma (total: up to 5g based on the weight of participant) were administrated via intravenous injection (vial 1) followed by another injection (vial 2) of same dosage of Idarucizumab for participants who were treated with dabigatran and had uncontrolled or life threatening bleeding that required urgent medical or surgical intervention or who required emergency surgery/urgent procedures where adequate haemostasis was required. Two equal injection parts were administered no more than 15 minutes (min) apart. The time between start of injection of the first vial and end of the second vial was 22 min.

Statistical analyses

No statistical analyses for this end point

Secondary: Percent change of coagulation time for diluted thrombin time (dTT) and ecarin clotting time (ECT) at 30 minutes post-dose compared with pre-dose

End point title	Percent change of coagulation time for diluted thrombin time (dTT) and ecarin clotting time (ECT) at 30 minutes post-dose compared with pre-dose
-----------------	--

End point description:

Percent change of coagulation time for diluted thrombin time (dTT) and ecarin clotting time (ECT) at 30 minutes (min) post-dose compared with pre-dose. Central blood sampling for dTT, ECT were to occur immediately prior to administration of each vial of Idarucizumab and post-dose at 30min, 4h, 12h and 24h. Pharmacodynamic (PD) set (PDS): comprising all patients in the TS who provided at least 1 evaluable pre-dose and at least 1 post-dose observation for PD endpoints or biomarker measures. The

PDS was used for the PD endpoint analyses. Note that for different PD endpoints or biomarkers, the number of evaluable patients could differ between endpoints.

End point type	Secondary
End point timeframe:

No statistical analyses for this end point

Secondary: Time to achieve reversal of the dabigatran effect (based on the coagulation time for dTT and ECT)

End point title	Time to achieve reversal of the dabigatran effect (based on the coagulation time for dTT and ECT)
-----------------	---

End point description:

Idarucizumab administration resulted in normalisation of dTT and ECT. Time to achieve reversal of anticoagulant effect of dabigatran based on the coagulation time for dTT and ECT, at any time point from the end of the second injection (vial 2) up to 24 hours . Reversal of the dabigatran effect at time t was defined as the $100 \% \times (\text{pre-dose coagulation time} - \text{post-dose coagulation time at time t}) / (\text{pre-dose coagulation test} - \text{upper limit of normal})$. Values equal to or higher than 100% were interpreted as reversal. Central blood sampling for dTT, ECT were to occur immediately prior to administration of each vial of Idarucizumab and post-dose at 30min, 4h, 12h and 24h. PD set : comprising all patients in the TS who provided at least 1 evaluable pre-dose and at least 1 post-dose observation for PD endpoints or biomarker measures. The PDS was used for the PD endpoint analyses. Note that for different PD endpoints, the number of evaluable patients could differ between endpoints.

End point type	Secondary

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? No

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

The patient had completed the treatment period, but the end-of-trial visit was by mistake scheduled 5 days earlier. Thus, the patient was formally considered as having prematurely discontinued the trial although all planned visits were performed.
