

Clinical trial results:

Early administration of anti-latency reversing therapy and broadly neutralizing antibodies to limit the establishment of the HIV-1 reservoir during initiation of antiretroviral treatment - a randomized controlled trial (eCLEAR)

Summary

EudraCT number	2015-002234-53
Trial protocol	DK GB
Global end of trial date	17 July 2021

Results information

Result version number	v1 (current)
This version publication date	15 December 2022
First version publication date	15 December 2022

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	01 February 2022
Is this the analysis of the primary completion data?	Yes
Primary completion date	03 March 2020
Global end of trial reached?	Yes
Global end of trial date	17 July 2021
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

To evaluate the effect of early viral reactivation by latency reversing agents (LRA) and/or administration of potent broadly neutralizing antibodies (bNAbs) on the size of the latent HIV-1 reservoir in treatment naïve HIV-1 patients initiating ART

Protection of trial subjects:

There is now considerable experience with the human safety profile of romidepsin. As of 31 December 2011, more than 1300 patients have been treated with romidepsin in clinical studies, and of those a total of 891 patients with at least one dose of romidepsin as monotherapy. The experience with 3BNC177 is sparse, but both uninfected and HIV-1infected individuals were given a single dose IV and monitored for 56 days. A total of 37 individuals have received 3BNC117 at doses ranging from 1 to 30 mg/kg, and there have been no significant AE related to 3BNC117 to date. Romidepsin is better characterized than 3BNC117, but both IMPs require monitoring and safety monitoring is described below:

Safety will be monitored by vital signs, clinical laboratory tests, history and physical examinations if needed and the rate and severity of AE. If indicated in the opinion of the investigator, a physical examination will be performed prior to and after completed infusion. Routine biochemistry (safety) will be performed prior to infusion. Infusion is postponed in case of unacceptable laboratory values prior to infusion, and laboratory tests may be repeated, as clinically indicated, to obtain acceptable values before withdraw from the study:

- o Hepatic transaminases (AST or ALT) $\geq 3 \times$ upper limit of normal (ULN)
- o Serum total bilirubin ≥ 3 ULN
- o Estimated glomerular filtration rate (eGFR) ≤ 60 mL/min (based on serum creatinine or other appropriate validated markers)
- o Platelet count $\leq 100 \times 10^9/L$
- o Absolute neutrophil count $\leq 1 \times 10^9/L$
- o Serum potassium, magnesium, phosphorus outside ≥ 1.5 ULN/LLN
- o Total calcium (corrected for serum albumin) or ionized calcium ≥ 1.5 ULN/LLN

A baseline ECG will be obtained at screening.

Upon completion of follow-up specified in this protocol at day 365, study subjects who do not enter the ATI will resume routine treatment and control following standard treatment guidelines.

Background therapy:

All four arms were started on integrase-inhibitor-based triple-ART regimen.

Evidence for comparator: -

Actual start date of recruitment	16 January 2017
Long term follow-up planned	Yes
Long term follow-up rationale	Safety, Efficacy, Scientific research
Long term follow-up duration	5 Years
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	United Kingdom: 12
Country: Number of subjects enrolled	Denmark: 47
Worldwide total number of subjects	59
EEA total number of subjects	47

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	57
From 65 to 84 years	2
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

Eligible individuals were given written information upon diagnosed with HIV-1 to participate in the study unless the individual refuses.

Eligible individuals were recruited from 16 January 2017 to 3 March 2020.

Pre-assignment

Screening details:

Screening occurred within 4 weeks before the baseline visit at day 0.

Newly diagnosed ART-naive participants aged 18 with a confirmed HIV-1 diagnosis and a CD4+ T cell count of >200 cells per mm³ at screening were recruited by study physicians.

During screening, we excluded 25% of the newly diagnosed individuals due to low CD4+ T cell count.

Notes:

[1] - Period 1 is not the baseline period. It is expected that period 1 will be the baseline period.

Justification: Yes, period 1 is baseline.

Number of subjects in period 2^[2][3]	ART alone	ART+3BNC117	ART+romidepsin
Started	4	5	5
ATI	4	5	5
Completed	4	5	5

Number of subjects in period 2^[2][3]	ART+3BNC117+romidepsin
Started	6
ATI	6
Completed	6

Notes:

[2] - The number of subjects reported to be in the baseline period are not the same as the worldwide number enrolled in the trial. It is expected that these numbers will be the same.

Justification: ATI was optional.

[3] - The number of subjects starting the period is not consistent with the number completing the preceding period. It is expected the number of subjects starting the subsequent period will be the same as the number completing the preceding period.

Justification: ATI was optional.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? No

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

Our study also has some limitations and may not be generalizable to all newly diagnosed individuals due to the study's stringent exclusion criteria.
