1301/2000 apply to this that:		l

Analysis stage	Final
Date of interim/final analysis	19 February 2019
Is this the analysis of the primary completion data?	Yes
Primary completion date	01 December 2017
Global end of trial reached?	Yes
Global end of trial date	01 December 2017
Was the trial ended prematurely?	No

Main objective of the trial:

To investigate the care of IVAN participants in the NHS, and changes to their vision, since the end of the IVAN trial in order to better inform future NHS strategies for treatment of wet Age-related Macular Degeneration.

To compare outcomes by original randomised allocations at 5-7 years after randomisation.

Protection of trial subjects:

Participants were in an observational study of usual care during a period after IMP was discontinued and the trial was closed. This was a follow up study of long term outcomes and participants were not put at any risk.

Background therapy:

Not applicable- see above

Evidence for comparator:

Not applicable- see above

Actual start date of recruitment	26 May 2016
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Country: Number of subjects enrolled	United Kingdom: 532
Worldwide total number of subjects	532
EEA total number of subjects	532

Notes:

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	19

From 65 to 84 years	384
85 years and over	129

Recruitment details:

All participants who did not die or withdraw from the IVAN trial were invited to participate in the follow up study by either attending a single research visit in person, for eye examinations and a questionnaire, or completing a questionnaire by post. They were also be offered the option to withdraw from the study.

Screening details:

Of the 610 patients recruited to the IVAN trial, 532 were included in the follow-up study; 66 died or withdrew during the IVAN trial, 7 were at a single site that did not participate in the extended IVAN follow up and 5 withdrew during the extended follow up. 124 of the 532 participants had died by the time of follow up.

Period 1 title	Follow-up cohort (overall period)
Is this the baseline period?	Yes
Allocation method	Not applicable
Blinding used	Not blinded

Blinding implementation details:

The participants were initially randomised to one of four treatment regimens in the original IVAN trial, and participants, clinical and trial personnel were masked. At the start of this study, after exiting the trial, participants were treated in the NHS. Although health professionals and participants have not been masked to ongoing care, ophthalmologists managing participants are extremely unlikely to know the original experimental allocation

Are arms mutually exclusive?	No
	Follow-up cohort

Arm description:

All participants in the extended follow-up study

Of the 532 participants in the extended follow-up study, 124 had died and 199 agreed to attend a specific research visit. Data were collected passively for non-attenders (124 deceased patients and 209 who did not wish to attend a research visit)

Arm type	Overall
No investigational medicinal product assigned in this arm	
	IVAN randomised allocation: Ranibizumab

Arm description:

This is an observational follow up of the original participants who were enrolled in the IVAN trial. The participants were initially randomised to one of four treatment regimens in the original IVAN trial and after exiting the trial, participants were treated in the NHS. The follow up study looked at the long term outcomes of these patients and is purely observational in that there was data collection but no intervention. This arm is the treatment allocation of the original IVAN trial.

Arm type	IVAN trial allocation (reference group)
Investigational medicinal product name	Lucentis
Investigational medicinal product code	
Other name	Ranibizumab
Pharmaceutical forms	Injection
Routes of administration	Intravitreal use
Dosage and administration details:	
Drug dose during IVAN trial: 0.5 mg	
	IVAN randomised allocation: Bevacizumab

Arm description:

Reporting group title Follow-up cohort

Reporting group description:

All participants in the extended follow-up study

Of the 532 participants in the extended follow-up study, 124 had died and 199 agreed to attend a specific research visit. Data were collected passively for non-attenders (124 deceased patients and 209 who did not wish to attend a research visit)

Reporting group title	IVAN randomised allocation: Ranibizumab
-----------------------	-----------------------------------------

Reporting group description:

This is an observational follow up of the original participants who were enrolled in the IVAN trial. The participants were initially randomised to one of four treatment regimens in the original IVAN trial and after exiting the trial, participants were treated in the NHS. The follow up study looked at the long term outcomes of these patients and is purely observational in that there was data collection but no intervention. This arm is the treatment allocation of the original IVAN trial.

Reporting group title	IVAN randomised allocation: Bevacizumab

Reporting group description:

Subject analysis set title Attenders
Subject analysis set type Sub-group analysis

Subject analysis set description:

Participants who attended a research visit as part of the IVAN follow-up study.

196/199 (98.5%) have at least one ophthalmology appointment as part of usual care since IVAN exit Length of follow up during usual care since IVAN entry (years, Median IQR): 6.8 (6.1, 7.4) Length of follow up during usual care since IVAN exit (years, Median IQR): 4.8 (4.2, 5.4)

Length of follow up to research appointment since IVAN entry (years, Median IQR): 7.3 (6.8, 7.8) Length of follow up to research appointment since IVAN exit (years, Median IQR): 5.3 (4.8, 5.8)

Subject analysis set title	Survivor, passive data collection only
Subject analysis set type	Sub-group analysis

Subject analysis set description:

Non-attenders (passive data collection only) - survivors

198/209 (94.7%) have at least one ophthalmology appointment as part of usual care since IVAN exit Length of follow up during usual care since IVAN entry (years, Median IQR): 6.3 (4.3, 7.4) Length of follow up during usual care since IVAN exit (years, Median IQR): 4.4 (2.3, 5.4)

Subject analysis set title Deceased, passive data collection only
Subject analysis set type Sub-group analysis

Subject analysis set description:

Non-attenders (passive data collection only) - deceased

112/124 (90.3%) have at least one ophthalmology appointment as part of usual care since IVAN exit Length of follow up during usual care since IVAN entry (years, Median IQR): 3.8 (3.0, 4.8) Length of follow up during usual care since IVAN exit (years, Median IQR): 1.7 (1.1, 2.8)

End point title	Development of intralesional macular atrophy (ILMA)

End point description:

ILMA = intralesional macular atrophy (defined as atrophy lying within the footprint of the neovascular lesion); Primary morphology outcome

Study eyes with ILMA at IVAN exit (baseline) were excluded from this analysis. Missing data imputed using multiple imputation methods.

We had intended to examine the impact of HRM type (well or ill defined). However, review of the OCT data did not support dichotomising participant eyes based on HRM. HRM was therefore modelled as present vs. absent.

ILMA= Intralesional macular atrophy, GA= Geographic atrophy, FU=Follow up, CNV= Choroidal neovascularisation, HRM= Hyperreflective material, PED= Pigment Epithelial Detachment, SRF= Subretinal fluid, nAMD= neovascular age-related macular degeneration, CI=Confidence interval

	End point type	Primary

End point title	Development/worsening of intralesional macular atrophy
	(ILMA)

End point description:

ILMA = intralesional macular atrophy (defined as atrophy lying within the footprint of the neovascular lesion)

This outcome was defined as the development (incident) or expansion of the area (worsened) of ILMA. Expansion of the area of ILMA was quantified and was classified as worsened when it increased by >20%. The outcome was defined to include worsening of ILMA so that the analyses did not exclude study eyes with ILMA at baseline.

Missing data imputed using multiple imputation methods. We had intended to examine the impact of HRM type (well or ill defined). However, review of the OCT data did not support dichotomising participant eyes based on HRM. HRM was therefore modelled as present vs. absent.

ILMA= Intralesional macular atrophy, GA= Geographic atrophy, FU=Follow up, CNV= Choroidal neovascularisation, HRM= Hyperreflective material, PED= Pigment Epithelial Detachment, SRF= Subretinal fluid, nAMD= neovascular age-related macular degeneration, CI=Confidence interval

Effect of trial drug allocation on EQ5D

Statistical analysis description:

For EQ-5D-5L, no transformation could be applied to the data to satisfy the assumptions for linear regression. Therefore, the index score was categorised (EQ-5D-5L score, 1 (no problem in any dimension), 0.80 to 0.99 (a moderate problem in only one dimension), 0.5 to 0.79 (at least two moderate problems in any dimension) and <0.5 (at least one extreme problem)) and ordinal logistic regression was used. These analyses were adjusted for centre size (seven strata as per the IVAN trial).

Comparison groups	IVAN randomised allocation: Ranibizumab v IVAN randomised
	allocation: Bevacizumab

Number of subjects included in analysis	273
Analysis specification	Pre-specified
Analysis type	equivalence
P-value	= 0.2419
Method	Regression, Logistic
Parameter estimate	Log odds ratio
Point estimate	1.3
Confidence interval	
level	95 %
sides	2-sided
lower limit	0.8
upper limit	2

Effect of trial treatment regimen on EQ5D

For EQ-5D-5L, no transformation could be applied to the data to satisfy the assumptions for linear regression. Therefore, the index score was categorised (EQ-5D-5L score, 1 (no problem in any dimension), 0.80 to 0.99 (a moderate problem in only one dimension), 0.5 to 0.79 (at least two moderate problems in any dimension) and <0.5 (at least one extreme problem)) and ordinal logistic regression was used. These analyses were adjusted for centre size (seven strata as per the IVAN trial).

Number of subjects included in analysis	267
Analysis specification	Pre-specified
Analysis type	equivalence
P-value	= 0.0413
Method	Regression, Logistic
Parameter estimate	Odds ratio (OR)
Point estimate	0.6
Confidence interval	
level	95 %
sides	2-sided
lower limit	0.4
upper limit	1

Effect	of GA on EQ5D
--------	---------------

For EQ-5D-5L, no transformation could be applied to the data to satisfy the assumptions for linear regression. Therefore, the index score was categorised (EQ-5D-5L score, 1 (no problem in any dimension), 0.80 to 0.99 (a moderate problem in only one dimension), 0.5 to 0.79 (at least two moderate problems in any dimension) and <0.5 (at least one extreme problem)) and ordinal logistic regression was used. These analyses were adjusted for EQ5D score at IVAN exit.

Comparison groups	Geographic atrophy (GA) absent in study eye v Geographic atrophy (GA) present in study eye
Number of subjects included in analysis	267
Analysis specification	Pre-specified
Analysis type	equivalence
P-value	= 0.9794
Method	Regression, Logistic
Parameter estimate	Odds ratio (OR)
Point estimate	1
Confidence interval	
level	95 %
sides	2-sided
lower limit	0.6
upper limit	1.7

Timeframe for reporting adverse events:

The AE reporting period for the study began upon completion of the consent form for the clinic appointment until the patient leaves the clinic appointment.

Adverse event reporting additional description:

Only patients who attended a clinic appointment as part of the IVAN follow-up study are included in the adverse events reporting group.

Adverse event that occurred during the clinic appointment were recorded. Any adverse events that occurred between the end of the IVAN trial and consent to the follow-up were considered medical history.

Assessment type	Systematic	
Dictionary name	N/A	
Dictionary version	N/A	
Reporting group title	Attenders	

Reporting group description: -

	Attenders	
Total subjects affected by serious adverse events		
subjects affected / exposed	0 / 199 (0.00%)	
number of deaths (all causes)	0	
number of deaths resulting from adverse events	0	

Frequency threshold for reporting non-serious adverse events: 0 %

	Attenders		
Total subjects affected by non-serious adverse events			
subjects affected / exposed	1 / 199 (0.50%)		
Eye disorders			
Vitreous floaters	Additional description: This is almost certainly an event that occurred historically but which was noted at the research visit attended by the participant.		
subjects affected / exposed	1 / 199 (0.50%)		
occurrences (all)	1		

Were there any global substantial amendments to the protocol? Yes

17 December 2015	SUBSTANTIAL AMENDMENT 1: Section 8 of the protocol (safety reporting) was updated substantially in line with the Sponsor's policy and a table added detailing the terms and definitions of adverse events. New wording was inserted into section 4.4.2 on secondary outcomes explaining that Best Corrected Visual Acuity would be measured with both standard and low luminance visual acuity.
08 March 2016	SUBSTANTIAL AMENDMENT 2: Grounds of Non-Acceptance were received for protocol v5.0 from the MHRA therefore the safety sections were updated further in line with their recommendations and protocol v6.0 was submitted for approval.
21 March 2016	SUBSTANTIAL AMENDMENT 3: A change was made to the Patient Information Leaflet clarifying that research nurses could telephone participants if the reply slip had not been returned after two weeks. The change was made in response to feedback from research nurses and the Macular Disease Society highlighting the importance of verbal communication in this elderly, visually impaired group of participants.

EU-CTR publication date: 24 March 2019

Notes:

Were there any global interruptions to the trial? No

None reported
