

Clinical trial results:

A prospective, multi-center, open-label, single-arm, Phase 2 study to assess the efficacy and safety of clazosentan in reversing angiographically-confirmed cerebral vasospasm in adult subjects with aneurysmal subarachnoid hemorrhage (aSAH) treated by surgical clipping or endovascular coiling.

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	14 July 2017
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	15 May 2017
Was the trial ended prematurely?	Yes

Notes:

General information about the trial

Main objective of the trial:

To evaluate whether clazosentan has an early effect in reversing angiographically-confirmed cerebral vasospasm in patients with aneurysmal subarachnoid hemorrhage treated by endovascular coiling or surgical clipping.

The study used a Simon 2-stage design. Stage 1 analysis was planned to be performed on the first 10 evaluable subjects, while stage 2 analysis was planned to be conducted, assuming positive stage 1 analysis, on the first 19 evaluable subjects.

Criterion to continue to stage 2 (positive stage 1 analysis) is met if > 2 subjects with successful reversal were observed.

Protection of trial subjects:

Prior to the start of the study, each study site consulted an Independent Ethics Committee (IEC) or Institutional Review Board (IRB), i.e., a review panel that was responsible for ensuring the protection of the rights, safety, and well being of human subjects involved in a clinical investigation. The sponsor and the investigators ensured that the study was conducted in full compliance with International Council for Harmonisation (ICH)-Good Clinical Practice (GCP) Guidelines, the principles of the "Declaration of Helsinki" and with the laws and regulations of the countries in which the research was conducted.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	04 December 2015
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Finland: 1
Country: Number of subjects enrolled	France: 9
Country: Number of subjects enrolled	Switzerland: 4
Worldwide total number of subjects	14
EEA total number of subjects	10

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0

Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	14
From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

The study was conducted at 11 sites in 3 countries from 21 March 2016 to 2 May 2017.

Pre-assignment

Screening details:

The study included a screening period of variable duration, starting any time after the aneurysm securing procedure and lasting up to a maximum of 14 days from the occurrence of the aneurysm to enrollment into the study.

At the time of study termination, 33 subjects had been screened and 14 subjects enrolled.

Period 1

Period 1 title	Overall trial (overall period)
Is this the baseline period?	Yes
Allocation method	Not applicable
Blinding used	Not blinded

Arms

Arm title	Clazosentan 15 mg/h
Arm description: -	
Arm type	Experimental
Investigational medicinal product name	Clazosentan
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Concentrate for solution for injection/infusion
Routes of administration	Intravenous use

Dosage and administration details:

Clazosentan was supplied as a concentrated solution for i.v. administration after dilution. The diluted study drug solution was administered as a continuous i.v. infusion at the dose of 15 mg/h for up to a cumulative maximum of 10 days.

Number of subjects in period 1	Clazosentan 15 mg/h
Started	14
Completed	14

End points

End points reporting groups

Reporting group title	Clazosentan 15 mg/h
Reporting group description: -	
Subject analysis set title	Evaluable set
Subject analysis set type	Sub-group analysis

Subject analysis set description:

Used for the main analysis of the primary and secondary endpoints and included subjects with:
Absence of violation of exclusion criteria related to forbidden medications and procedures.
Presence of a DSA evaluable for global cerebral vasospasm at baseline and at 3h / 24 h post-study drug initiation.

Primary: Successful reversal of global cerebral vasospasm (GV) 3 h post study drug initiation

End point title	Successful reversal of global cerebral vasospasm (GV) 3 h post study drug initiation ^[1]
-----------------	---

End point description:

Successful reversal was defined as an improvement in at least one level of severity on the global vasospasm assessment (i.e., from severe to moderate, mild, or none, or from moderate to mild or none) evaluated on DSA. The presence/absence of vasospasm (vsp) was determined at the level of the following 15 proximal (vertebro basilar, left/right intradural ICA, left/right A1, left/right M1, left/right P1) and distal (left/right A2, left/right P2, left/right M2) brain vessels.

The severity of the vsp in each vessel segment was indicated as follows:

None: no vsp

Mild: up to 1/3 vessel narrowing

Moderate: more than 1/3 and up to 2/3 vessel narrowing

Severe: more than 2/3 vessel narrowing

The severity of global vsp was indicated as follows:

No significant vsp: ≤2 segments with mild vsp

Mild: >2 segments with mild and/or 1 segment with moderate vsp

Moderate: ≥2 segments with moderate and/or 1 segment with severe vsp

Severe: ≥2 segments with severe vsp

End point type	Primary
----------------	---------

End point timeframe:

3 hours post study-drug initiation

Notes:

[1] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: Not applicable.

Post-hoc: Distribution of responding segments (i.e., score ≥ 2) by location at 3 h and 24 h

End point title	Distribution of responding segments (i.e., score ≥ 2) by location at 3 h and 24 h
-----------------	---

End point description:

This endpoint was assessed post-hoc with the objective to better characterize the pharmacodynamic effect of clazosentan on the entire cerebral vasculature, including smaller distal vessel segments and the cerebellar arteries. This evaluation considered a larger number of vessel segments (29) than the primary endpoint evaluation (15 segments).

Segments were defined as proximal (ICA, A1, M1, vertebral artery, basilar artery, P1) or distal (A2, A3/A4, M2, M3/M4, P2, P3/P4, anterior inferior cerebellar artery, posterior inferior cerebellar artery, superior cerebellar artery). Each evaluable segment with significant vasospasm on the baseline angiogram was graded at 3 h and 24 h post initiation of clazosentan with a 7-level scoring system ranging from -3 for severe worsening to +3 for improvement back to admission state. A segment with a score ≥ 2 (corresponding to at least a significant improvement) was considered as responding.

End point type	Post-hoc

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
17 June 2016	<p>Summary of most relevant changes:</p> <p>Modified entry criteria:</p> <ul style="list-style-type: none">- The CT scan at 2448 h post aneurysm-securing procedure was removed since any procedure-related injury would have been detected on the CT scan performed just prior to study enrollment.- The definition of severe hypoxemia was modified from $\text{PaO}_2/\text{FiO}_2 < 300$ to $\text{PaO}_2/\text{FiO}_2 < 250$, which was a more realistic definition of severe hypoxemia.- Upon sponsor approval at site level, a CTA could replace a missing or incomplete DSA, at hospital admission. <p>definition of CCT secondary endpoint and how it was to be derived were made:</p> <p>CCT secondary endpoint definition:</p> <ul style="list-style-type: none">- The endpoint was modified from change in angiographic CCT to maximum change in angiographic CCT. <p>The recommendation to perform the TCD at 3 h post study drug initiation was waived. Also, it was acceptable to perform the hourly TCD assessments only in the vessel that showed the highest mean flow velocity at baseline</p>

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? Yes

Date	Interruption	Restart date
15 May 2017	<p>The study was ended prematurely after the planned stage 1 analysis revealed successful reversal of global cerebral vasospasm, based on the primary endpoint definition, in 2 out of the first 10 evaluable subjects. The protocol-specified statistical criterion to prematurely stop the study due to insufficient efficacy was met.</p> <p>However, the primary endpoint definition of successful reversal only considered the larger cerebral artery segments using a semi-quantitative evaluation. A second review of the angiograms was therefore performed, by two external experts, taking into account the smaller more distal artery segments and the cerebellar arteries, using a quantitative evaluation scale. The post-hoc analysis showed a clearly visible pharmacodynamic effect at 3 h, that was even more pronounced at 24 h, in a significant proportion of segments and subjects, in both large proximal and small distal vessels. This effect was also observed in cases that were judged to be unsuccessful reversals according to the pre-defined primary endpoint definition.</p>	-
