

Clinical trial results:

Personalised prospective comparison of ARni with ArB in patients with natriuretic peptide eLEvation (PARABLE)

Summary

EudraCT number	2015-002928-53
Trial protocol	IE
Global end of trial date	11 June 2021

Results information

Result version number	v1 (current)
This version publication date	21 December 2022
First version publication date	21 December 2022

Trial information

Trial identification

Sponsor protocol code	HBT-GCP-PTCL-01

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	12 March 2020
Is this the analysis of the primary completion data?	Yes
Primary completion date	12 March 2020
Global end of trial reached?	Yes
Global end of trial date	11 June 2021
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

To assess the impact of LCZ696 (ARNI) versus angiotensin receptor blocker (ARB) (valsartan) on left ventricular diastolic function (as measured by cardiac magnetic resonance imaging) over 18 months.

Protection of trial subjects:

The PARABLE study was conducted in compliance with the principles laid down in the Declaration of Helsinki, ICH-GCP, the requirements of the EU Data Protection Regulation, and all applicable EU and national laws. The study investigators and staff were provided with information to ensure that the study was performed to the highest possible standard, with particular attention to the patients' rights and their protection. Study protocols including consent documents were approved in by an approved Ethics Committee (EC) and the national competent authority. Safeguards were in place to minimise any risk of privacy and confidentiality breaches. Participants were adequately informed prior to their inclusion about the voluntary nature of his/her participation, confidentiality and protection of his/her data, potential risks and benefits of participation, insurance coverage and the possibility of withdrawal at any time. Freely given informed consent was obtained from and documented in writing, signed and dated personally by each patient before inclusion in the study. Safety information was collected throughout the study. Serious adverse events (SAEs) were reviewed the Principal Investigator and notified to the local EC each month. Listings of SAEs were presented to the Data Management Board every 6 months for discussion and review.

Background therapy:

Following enrollment, therapy with angiotensin converting enzyme inhibitors (ACEIs) or angiotensin receptor blockers (ARBs) were discontinued. Other background medications remained unchanged.

Evidence for comparator:

LCZ696 (sacubitril/valsartan), is a first-in-class angiotensin receptor neprilysin inhibitor (ARNI). In addition to blockade of the renin-angiotensin-aldosterone system (RAAS) via the valsartan moiety, the sacubitril component inhibits neprilysin, resulting in reduced degradation of biologically active natriuretic peptides. A previous 36-week study showed that LCZ696 in comparison with valsartan can provide greater reduction in left atrial volume index (LAVI), a continuous imaging surrogate of left ventricular diastolic dysfunction, when given to patients with heart failure. In the PARABLE study, valsartan was chosen as the comparator to assess the relative impact of both agents on LAVI in at-risk, asymptomatic patients with elevated natriuretic peptides over 18 months.

200mg of LCZ696 twice daily delivers similar exposure of valsartan (assessed by AUC) as valsartan 160mg twice daily. (Novartis Company Information).

Actual start date of recruitment	05 April 2016
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Ireland: 250
--------------------------------------	--------------

Worldwide total number of subjects	250
EEA total number of subjects	250

Notes:

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	39
From 65 to 84 years	202
85 years and over	9

Subject disposition

Recruitment

Recruitment details: -

Pre-assignment

Screening details:

323 people were screened and 250 were enrolled into the study. Male or females, ≥ 40 years with cardiovascular risk factors were invited to participate (this information was available from their medical notes). Subjects underwent an echocardiographic assessment of LAVI and a blood sample was obtained for measurement of natriuretic peptide levels.

Period 1

Period 1 title	Baseline
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Monitor, Data analyst, Carer, Assessor

Arms

Are arms mutually exclusive?	Yes
Arm title	LCZ696

Arm description:

Treatment with LCZ696 (sacubitril/valsartan).

Following randomisation, treatment with existing ACEI or ARB therapy was discontinued. A 36-hour wash-out period was required for anyone previously taking an ACEI.

Standard dose regimen: LCZ696 100mg (Phase 2) twice daily for 2 weeks titrated to 200mg (Phase 3) twice daily for the remaining 18-month study period.

Lower dose regimen: A starting dose of LCZ696 50mg (Phase 1) twice daily was used for anyone not currently taking an ACEI or ARB and for subjects previously taking low doses of these agents (as per Investigator judgement). A lower dosing regimen was also used for subjects with a systolic BP of ≥ 100 mm to 110mmHg at screening or baseline. This was then titrated to 100mg (Phase 2) twice daily for another 2 weeks then titrated to the target dose of 200mg (Phase 3) twice daily for the remaining 18-month study period.

Arm type	Experimental
Investigational medicinal product name	LCZ696
Investigational medicinal product code	
Other name	Sacubitril/valsartan, Entresto
Pharmaceutical forms	Coated tablet
Routes of administration	Oral use

Dosage and administration details:

Standard dose regimen: LCZ696 100mg (Phase 2) twice daily for 2 weeks titrated to 200mg (Phase 3) twice daily for the remaining 18-month study period.

Lower dose regimen: LCZ696 50mg (Phase 1) twice daily, for 2 weeks, titrated to 100mg (Phase 2) twice daily for 2 weeks, then further titrated to 200mg (Phase 3) twice daily for the remaining 18 month study period. The formulation was a coated tablet for oral administration.

Arm title	Valsartan
------------------	-----------

Arm description:

Treatment with Valsartan.

Following randomisation, treatment with existing ACEI or ARB therapy was discontinued. A 36-hour wash-out period was required for anyone previously taking an ACEI.

Standard dose regimen: Valsartan 80mg (Phase 2) twice daily for 2 weeks titrated to 160mg (Phase 3) twice daily for the remaining 18-month study period.

Lower dose regimen: A starting dose of valsartan 40mg (Phase 1) twice daily was used for anyone not currently taking an ACEI or ARB and for subjects previously taking low doses of these agents (as per Investigator judgement). A lower dosing regimen was also used for subjects with a systolic BP of ≥ 100 mm to 110mmHg at screening or baseline. This was then titrated to 80mg (Phase 2) twice daily for

another 2 weeks then titrated to the target dose of 160mg (Phase 3) twice daily for the remaining 18-month study period.

Arm type	Active comparator
Investigational medicinal product name	Valsartan
Investigational medicinal product code	
Other name	Diovan
Pharmaceutical forms	Film-coated tablet
Routes of administration	Oral use

Dosage and administration details:

Standard dose regimen: LCZ696 100mg (Phase 2) twice daily for 2 weeks titrated to 200mg (Phase 3) twice daily for the remaining 18-month study period.

Lower dose regimen: LCZ696 50mg (Phase 1) twice daily, for 2 weeks, titrated to 100mg (Phase 2) twice daily for 2 weeks, then further titrated to 200mg (Phase 3) twice daily for the remaining 18 month study period. The formulation was a coated tablet for oral administration.

Lower dose regimen: A starting dose of LCZ696 50mg (Phase 1) twice daily was used for anyone not currently taking an ACEI or ARB and for subjects previously taking low doses of these agents (as per Investigator judgement). A lower dosing regimen was also used for subjects with a systolic BP of ≥ 100 mm to 110mmHg at screening or baseline. This was then titrated to 100mg (Phase 2) twice daily for another 2 weeks then titrated to the target dose of 200mg (Phase 3) twice daily for the remaining 18-month study period.

Reporting group title	Valsartan
-----------------------	-----------

Reporting group description:

Treatment with Valsartan.

Following randomisation, treatment with existing ACEI or ARB therapy was discontinued. A 36-hour wash-out period was required for anyone previously taking an ACEI.

Standard dose regimen: Valsartan 80mg (Phase 2) twice daily for 2 weeks titrated to 160mg (Phase 3) twice daily for the remaining 18-month study period.

Lower dose regimen: A starting dose of valsartan 40mg (Phase 1) twice daily was used for anyone not currently taking an ACEI or ARB and for subjects previously taking low doses of these agents (as per Investigator judgement). A lower dosing regimen was also used for subjects with a systolic BP of ≥ 100 mm to 110mmHg at screening or baseline. This was then titrated to 80mg (Phase 2) twice daily for another 2 weeks then titrated to the target dose of 160mg (Phase 3) twice daily for the remaining 18-month study period.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
29 February 2016	<p>Removal of glucose testing as a safety assessment at each timepoint. Glucose assessment was unnecessary and was included in error in the previous version of the protocol.</p> <p>Inclusion of two additional timepoints for cGMP assessment (at 4 weeks and 3 months in addition to baseline, 9 and 12 month timepoints). On reviewing the results of the PARADIGM study (LCZ696 vs enalapril), the maximum change in cGMP was detected at approximately 4 weeks with the levels plateauing out at subsequent timepoints</p> <p>Replacement of the Mini-Mental State Examination (brief version) with the Standardised MMSE as the cognitive assessment tool. This is a more reliable cognitive assessment tool with less variability and variance than the brief version</p> <p>The 'history of malignancy' exclusion criteria was amended to exclude only those with active malignancy or other diseases that would compromise life expectancy. The larger PARADIGM study which randomised 8,442 patients to LCZ696 or enalapril did not exclude patients with a history of malignancy unless their life expectancy was compromised.</p> <p>Further clarification was given on how to measure waist and hip ratio to avoid any variability in this measurement</p>
24 June 2016	<p>The inclusion criteria was amended to allow subjects with lower natriuretic peptide levels to be included in the study.</p> <p>People with BNP between 35 - 280pg/ml were now eligible for inclusion into the study (the previous cut-off was >50pg/ml)</p> <p>People with NT-proBNP between >125 - 1,000 pg/ml were now eligible for inclusion into the study (the previous cut-off was >250pg/ml)</p>
03 August 2016	<p>Updates to the Reference Safety Information for LCZ696 (Investigators Brochure) were submitted to the HPRA. Changes to the RSI are always considered substantial.</p>
19 December 2016	<p>Inclusion criteria amended to include subjects with lower natriuretic peptide levels. People with BNP 20-280pg/ml are now eligible (previous cut-off >35pg/ml). People with NT-proBNP 100-1,000 pg/ml are now eligible (previous cut-off >125pg/ml).</p> <p>Rationale: The aim of the study is to evaluate the effectiveness of LCZ696 in an asymptomatic population at risk of developing heart failure. Elevated levels of NP indicate a heightened risk of heart failure and other cardiovascular events. The results of a prospective study of 3,346 patients without heart failure, with a mean follow-up time of 5.2 years showed an excess risk at BNP levels of 20 pg/ml for men and 23.3 pg/ml for women (Wang, Larson et al. 2004) which is well below current thresholds used to diagnose heart failure. A sub-analysis of the STOP-HF data which included 429 patients with uncomplicated hypertension, showed the optimal threshold for BNP to predict major adverse cardiovascular events and death was 20pg/ml. (Heartbeat Trust, Data on File). Therefore, consistent with an increased risk of developing HF at BNP levels as low as 20pg/ml we would like to propose a lower NP threshold level. The risk thresholds for NT-proBNP are less well-defined. However, based on a correlation between 100 consecutive patients with simultaneous BNP and NT-proBNP measurements, a NT-proBNP level of 100pg/ml is comparable to a BNP level of 20pg/ml (Heartbeat Trust, Data on File).</p> <p>Exclusion criteria amendment. Previously, people with a "history of asymptomatic left ventricular systolic dysfunction defined as LVEF <50%, at any time" were excluded. This criteria was amended to only exclude patients with an LVEF <50% on the most recent measurement.</p> <p>Rationale: The target population is one at increased risk of heart failure which will include subjects with a history of coronary events. A transient drop in LVEF is not unexpected during and shortly after such cardiac events which would exclude patients under the previous criteria.</p>

26 October 2017	<p>The study objectives were amended as follows: "To provide further information in the target population on the safety and tolerability of LCZ696 versus valsartan" was changed from an exploratory objective to a secondary objective.</p> <p>Rationale: The Investigators wished to emphasise the importance of safety by making it a secondary objective. The manner in which safety was assessed during the study was not changed in any way.</p> <p>The timelines for performing cardiac MRI were amended and the 9 month timepoint removed such that this procedure was performed at baseline and end-of-study only. An additional site was added for carrying out MRIs.</p> <p>Rationale: The Investigators had access to a limited number of MRI slots for PARABLE subjects. A second site was opened to increase availability of MRI slots. It is unlikely that any structural changes in the heart would be evident after 9 months of study drug.</p> <p>The need for gadolinium containing contrast during the MRI was removed from the protocol.</p> <p>Rationale: The use of gadolinium was included in the initial protocol in error. Gadolinium is not required for the measurement of left atrial volume index (LAVI). There are risks associated with the use of gadolinium including minor side-effects (nausea, headaches, paraesthesia, hypotension) and rarely anaphylaxis and nephrogenic systemic fibrosis.</p>
19 December 2018	<p>Two secondary objectives added: 1) To assess response based on genetic variants of the NPPB, NPRA and NPPC genes; 2) Change in the incidence of progression of left ventricular dysfunction.</p> <p>Rationale: Genetic variant rs198389 of Nppb increases BNP and this is cardioprotective in at-risk patients. It is important to know if any benefits of LCZ696 are independent of genetic variants of key genes involved in the expression and metabolism of BNP.</p> <p>PARABLE is examining progression of left ventricular diastolic dysfunction. Endpoints include echo and cardiac MRI measures of diastolic dysfunction. An additional composite describing numbers of patients with progression of diastolic dysfunction is added.</p> <p>Two exploratory objectives added: 1) To assess the difference between groups in terms of atrial fibrillation (AF); 2) To assess response of immune cells to LCZ696</p> <p>Rationale: As AF is influenced by atrial fibrosis, inflammation and hypertrophy, it is important to investigate relationships between AF, LAVI, natriuretic peptide and LCZ696. A non-invasive cardiac rhythm monitor will be placed on a sub-set of up to 60 patients per group for up to 6 days.</p> <p>Monocytosis is present in patients with left ventricular diastolic dysfunction, and monocyte derived macrophages are present in dysfunctional and fibrosed cardiac tissue. BNP can attenuate monocyte chemotaxis. We will examine the relative impact of LCZ696 on monocyte gene expression using next generation sequencing.</p> <p>Exclusion criterion amended. Hepatic dysfunction was defined as any LFT exceeding 3x the upper limit of normal (ULN). This was amended to exclude only with raised AST or ALT.</p> <p>Rationale: GGT is not an exclusion criterion; it is not specific in the diagnosis of liver disease.</p> <p>The statistical methods section was described in more detail.</p> <p>Additional information on sample size included following a blinded review of 9-month echo data/effect size of 125 subjects. However, the sample size remains at 250.</p>
07 March 2019	<p>Changes to the site for QP release of the study drug. At study set-up, the study drug was released by Novartis in their London manufacturing facilities. In preparation for Brexit, an additional site for QP release was identified in the Republic of Ireland. Almac Clinical Services Limited continued to be the distributor but the IMP was transferred from the Craigavon site (Northern Ireland) to the Co Louth facility before 29 March 2019. Future batches of IMP from Novartis, UK, were shipped directly to this Almac site and the QP release was performed there.</p>

11 June 2019	A nine month follow-up sub-study was added to the protocol. The objective was to evaluate if any of the treatment effects observed during the 18-month study persisted nine-months after study drug discontinuation or whether there was disease regression. This sub-study involved a single visit to the Investigator Site at month 27 (9 months after study drug discontinuation). The assessments and procedures carried out during this follow-up visit were identical to those carried out at baseline, 9 and 18 months (physical exam, measurement of BP, heart rate, height, weight, waist and hip, blood and urine for biomarkers, 24-hour ABPM, echocardiography, ECG and administration of questionnaires; 5-7 day holter monitoring was optional and cardiac MRI was not done).
06 October 2020	<p>Based on research conducted and published by the investigator team, and evidence that intervention can modulate the risk for progression of atrial cardiomyopathy and LAVI, further blood biomarkers of inflammation, fibrosis, inflammation, metabolism, platelet function, thrombosis and coagulation were added to the protocol.</p> <p>The primary endpoint of the study is LAVI, which is an important component of atrial cardiomyopathy. Furthermore, research by the Investigator team suggests that the intervention may favourably modulate the progression of other aspects of atrial cardiomyopathy such as electrophysiological measures and fibrosis, as well ALVDD. Therefore, additional secondary endpoints were added to the protocol to assess the impact of LCZ696 dependent on atrial cardiomyopathy at baseline as well as progression of atrial cardiomyopathy.</p> <p>Final changes, clarifications and additions were made to the secondary and exploratory endpoints. This acknowledges that the study is looking at a range of measures of atrial structure and function, as well as ventricular structure and function. In particular, this reflects new cMRI assessment techniques available. These prespecified endpoints maximise the value of the data in the context of the overall research aims and objectives.</p>
16 April 2021	Amendments relate to the secondary and exploratory objectives and endpoints of the study outlined in Section 10.1 and 10.2 of the study protocol.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
