Notes:

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	31 May 2019
Is this the analysis of the primary completion data?	No

Global end of trial reached?	Yes
Global end of trial date	31 May 2019
Was the trial ended prematurely?	Yes

Notes:

General information about the trial

Main objective of the trial:

To evaluate the safety and efficacy of Crenezumab

Protection of trial subjects:

All study subjects were required to read and sign an Informed Consent Form.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	22 March 2016
Long term follow-up planned	Yes
Long term follow-up rationale	Safety, Efficacy
Long term follow-up duration	13 Months
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Australia: 16
Country: Number of subjects enrolled	Austria: 3
Country: Number of subjects enrolled	Belgium: 2
Country: Number of subjects enrolled	Bulgaria: 6
Country: Number of subjects enrolled	Canada: 45
Country: Number of subjects enrolled	Switzerland: 2
Country: Number of subjects enrolled	Costa Rica: 7
Country: Number of subjects enrolled	Czech Republic: 3
Country: Number of subjects enrolled	Germany: 39
Country: Number of subjects enrolled	Denmark: 12
Country: Number of subjects enrolled	Spain: 108
Country: Number of subjects enrolled	Finland: 7
Country: Number of subjects enrolled	France: 21
Country: Number of subjects enrolled	United Kingdom: 28
Country: Number of subjects enrolled	Hong Kong: 7
Country: Number of subjects enrolled	Croatia: 11
Country: Number of subjects enrolled	Hungary: 7
Country: Number of subjects enrolled	Italy: 50
Country: Number of subjects enrolled	Japan: 20
Country: Number of subjects enrolled	Korea, Republic of: 24

Country: Number of subjects enrolled	Lithuania: 10
Country: Number of subjects enrolled	Mexico: 32
Country: Number of subjects enrolled	Poland: 14
Country: Number of subjects enrolled	Portugal: 6
Country: Number of subjects enrolled	Russian Federation: 38
Country: Number of subjects enrolled	Slovenia: 1
Country: Number of subjects enrolled	Sweden: 16
Country: Number of subjects enrolled	Turkey: 16
Country: Number of subjects enrolled	Ukraine: 8
Country: Number of subjects enrolled	United States: 254
Worldwide total number of subjects	813
EEA total number of subjects	344

Notes:

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	182
From 65 to 84 years	625
85 years and over	6

Subject disposition

Recruitment

Recruitment details:

The study was conducted at 249 centers in 30 countries.

Pre-assignment

Screening details:

A total of 813 subjects were enrolled at 249 centers. 4 subjects did not receive any study treatment meaning that the modified intent-to-treat and safety populations consisted of 809 subjects.

Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Investigator, Subject

Arms

Are arms mutually exclusive?	Yes
Arm title	Placebo

Arm description:

Subjects received intravenous (IV) infusion of Placebo every 4 weeks (Q4W) for 100 weeks.

Arm type	Placebo
Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Concentrate for solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

Placebo was administered by intravenous (IV) infusion every 4 weeks (Q4W) at a matching dosage to Crenezumab of 60mg/kg.

Arm title	Crenezumab

Arm description:

Subjects received intravenous (IV) infusion of Crenezumab every 4 weeks (Q4W) for 100 weeks.

Arm type	Experimental
Investigational medicinal product name	Crenezumab
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Concentrate for solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

Crenezumab was administered by intravenous (IV) infusion every 4 weeks (Q4W) at a dose of 60mg/kg.

Number of subjects in period 1	Placebo	Crenezumab
Started	409	404
Completed	88	85
Not completed	321	319
Adverse event, serious fatal	4	6
Consent withdrawn by subject	32	31
Physician decision	-	2
Adverse event, non-fatal	16	13
Study Terminated By Sponsor	257	254
Multiple Reasons	9	9
Non-Compliance With Study Drug	1	-
Symptomatic Deterioration	-	2
Lost to follow-up	2	2

End points

End points reporting groups

Reporting group title	Placebo
Reporting group description:	
Subjects received intravenous (IV) infusion of Placebo every 4 weeks (Q4W) for 100 weeks.	
Reporting group title	Crenezumab
Reporting group description:	
Subjects received intravenous (IV) infusion of Crenezumab every 4 weeks (Q4W) for 100 weeks.	
Subject analysis set title	Placebo (Modified ITT)
Subject analysis set type	Modified intention-to-treat
Subject analysis set description:	
Subjects received intravenous (IV) infusion of Placebo every 4 weeks (Q4W) for 100 weeks. The Modified Intent-To-Treat population (Placebo (n = 407); Cren (n = 402)) was defined as all randomized subjects who received at least 1 dose of study drug, with subjects grouped according to the treatment assigned at randomization.	
Subject analysis set title	Crenezumab (Modified ITT)
Subject analysis set type	Modified intention-to-treat
Subject analysis set description:	
Subjects received intravenous (IV) infusion of Crenezumab every 4 weeks (Q4W) for 100 weeks. The Modified Intent-To-Treat population (Placebo (n = 407); Cren (n = 402)) was defined as all randomized subjects who received at least 1 dose of study drug, with subjects grouped according to the treatment assigned at randomization.	
Subject analysis set title	Placebo (Safety)
Subject analysis set type	Safety analysis
Subject analysis set description:	
Subjects received intravenous (IV) infusion of Placebo every 4 weeks (Q4W) for 100 weeks. The Safety analysis population included all randomized subjects who received at least 1 dose of study drug with subjects grouped according to actual treatment received. If a subject received at least 2 vials of crenezumab, then they were placed in the crenezumab arm.	
Subject analysis set title	Crenezumab (Safety)
Subject analysis set type	Safety analysis
Subject analysis set description:	
Subjects received intravenous (IV) infusion of Placebo every 4 weeks (Q4W) for 100 weeks. The Safety analysis population included all randomized subjects who received at least 1 dose of study drug with subjects grouped according to actual treatment received. If a subject received at least 2 vials of crenezumab, then they were placed in the crenezumab arm.	

Primary: Change from Baseline to Week 105 in Clinical Dementia Rating-Sum of Boxes (CDR-SB) Score

End point title	Change from Baseline to Week 105 in Clinical Dementia Rating-Sum of Boxes (CDR-SB) Score
End point description:	
The CDR-SB rates impairment in 6 categories (memory, orientation, judgement and problem solving, community affairs, home and hobbies and personal care) on a 5-point scale in which no impairment = 0, questionable impairment = 0.5 and mild, moderate and severe impairment = 1, 2 and 3 respectively. The score range is from 0 to 18 with a high score indicating a high disease severity. The difference in mean change from Baseline to Week 105 between Crenezumab and Placebo treated subjects was estimated. Mixed model repeated measures (MMRMs) adjusting for disease severity, APOEe4 status, geographic region and the use or non-use of anti-dementia medications at baseline were used to estimate the mean change from baseline for this primary endpoint. Data after 29 January 2019 are censored for the primary and secondary efficacy analyses to avoid potential biases due to investigators, subjects, raters, etc. being potentially influenced by early closure of the study due to lack of efficacy.	
End point type	Primary
End point timeframe:	
Baseline, Week 105	

End point values	Placebo (Modified ITT)	Crenezumab (Modified ITT)		
Subject group type	Subject analysis set	Subject analysis set		
Number of subjects analysed	88[1]	86[2]		
Units: Units on a Scale				
least squares mean (standard error)				
Week 105	3.42 (± 0.263)	3.59 (± 0.264)		

Notes:

Secondary: Change from Baseline to Week 105 on Cognition, as assessed by Alzheimer's Disease Assessment Scale-Cognition (ADAS-Cog) (subscale) 13 (ADAS-Cog-13)

End point title	Change from Baseline to Week 105 on Cognition, as assessed by Alzheimer's Disease Assessment Scale-Cognition (ADAS-Cog) (subscale) 13 (ADAS-Cog-13)

End point description:

The ADAS-Cog-13 assesses multiple cognitive domains including memory, comprehension, praxis, orientation, and spontaneous speech. Most of these are assessed by tests although some are rated by the clinician on a 5-point scale. The ADAS-Cog-13 is the ADAS-Cog-11 with 2 further items: delayed word recall and total digit cancellation. The score range for ADAS-Cog-13 is from 0 to 85 with high scores representing severe dysfunction. The difference in mean change from Baseline to Week 105 between Crenezumab and Placebo treated subjects was estimated. Mixed model repeated measures (MMRMs) adjusting for disease severity, APOEe4 status, geographic region, and the use or non-use of anti-dementia medications at baseline were used to estimate the mean change from baseline. Data presented below is only for subjects that were included in the actual analysis.

Secondary: Change from Baseline to Week 105 on Severity of Dementia, Assessed Using the CDR-Global Score (CDR-GS)

End point title	Change from Baseline to Week 105 on Severity of Dementia, Assessed Using the CDR-Global Score (CDR-GS)

End point description:

The CDR-GS represents a semi-structured interview which rates impairment in 6 categories (memory, orientation, judgement and problem solving, community affairs, home and hobbies, and personal care) on a 5-point scale in which CDR 0 = no dementia and CDR 0.5, 1, 2 or 3 = questionable, mild, moderate or severe dementia respectively. The range in scores for the CDR-GS is from 0 to 3 and a high score on the CDR-GS would indicate a high disease severity. The difference in mean change from Baseline to Week 105 between Crenezumab and Placebo treated subjects was estimated. Mixed model repeated measures (MMRMs) adjusting for disease severity, APOEe4 status, geographic region, and the use or non-use of anti-dementia medications at baseline were used to estimate the mean change from baseline. Data presented below is only for subjects that were included in the actual analysis.

Secondary: Change from Baseline to Week 105 on Severity of Dementia, Assessed Using the Mini Mental State Evaluation (MMSE)

End point title	Change from Baseline to Week 105 on Severity of Dementia, Assessed Using the Mini Mental State Evaluation (MMSE)

End point description:

The MMSE is a set of standardized questions used to evaluate possible cognitive impairment and help stage the severity level of this impairment. The questions target 6 areas: orientation, registration, attention, short-term recall, language and constructional praxis/visuospatial abilities. The scores on the MMSE range from 0 to 30, with higher scores indicating better function. The difference in mean change from Baseline to Week 105 between Crenezumab and Placebo treated subjects was estimated. Mixed model repeated measures (MMRMs) adjusting for disease severity, APOEe4 status, geographic region, and the use or non-use of anti-dementia medications at baseline were used to estimate the mean change from baseline. Secondary: Change from Baseline to Week 105 on function as assessed by the ADCS-ADL total score

End point title	Change from Baseline to Week 105 on function as assessed by the ADCS-ADL total score

End point description:

The ADCS-ADL (Alzheimer's Disease Cooperative Study-Activities of Daily Living) is the scale most widely used to assess functional outcomes in subjects with AD. The ADCS-ADL covers both basic ADL (e.g., eating and toileting) and more complex 'instrumental' ADL or iADL (e.g., using the telephone, managing finances and preparing a meal). The ADCS-ADL consists of 23 questions with a score range of 0 to 78 where a higher score represents better function. The difference in mean change from Baseline to Week 105 between Crenezumab and Placebo treated subjects was estimated. Mixed model repeated measures (MMRMs) adjusting for disease severity, APOEe4 status, geographic region, and the use or non-use of anti-dementia medications at baseline were used to estimate the mean change from baseline. Data presented below is only for subjects that were included in the actual analysis.

Secondary: Change from Baseline to Week 105 assessed using the Neuropsychiatric Inventory Questionnaire (NPI-Q)

End point title	Change from Baseline to Week 105 assessed using the Neuropsychiatric Inventory Questionnaire (NPI-Q)

End point description:

The NPI-Q is an informant-based instrument that evaluates 12 neuropsychiatric disturbances common in dementia: delusions, hallucinations, agitation, dysphoria, anxiety, apathy, irritability, euphoria, disinhibition, aberrant motor behavior, night-time behavioral disturbances and appetite and eating abnormalities. The severity of each neuropsychiatric symptom is rated on a 3-point scale (mild, moderate and marked). The total severity score range is from 0 to 36 with higher scores representing higher severity. The difference in mean change from Baseline to Week 105 between Crenezumab and Placebo treated subjects was estimated. Mixed model repeated measures (MMRMs) adjusting for disease severity, APOEe4 status, geographic region, and the use or non-use of anti-dementia medications at baseline were used to estimate the mean change from baseline.

End point title	Quality of Life-Alzheimer's Disease (QoL-AD) Scale Score

End point description:

The QoL-AD (Quality of Life - Alzheimer's Disease) scale assesses QoL in subjects who have dementia. The QoL-AD consists of 13 items covering aspects of subjects' relationships with friends and family, physical condition, mood, concerns about finances and overall assessment of QoL. Items are rated on 4-point Likert-type scales ranging from 1 [poor] to 4 [excellent]. The score range is from 13 to 52, with higher scores indicating a better QoL. The difference in mean change from Baseline to Week 105 between Crenezumab and Placebo treated subjects was estimated. Mixed model repeated measures (MMRMs) adjusting for disease severity, APOEe4 status, geographic region, and the use or non-use of anti-dementia medications at baseline were used to estimate the mean change from baseline. End point title	Zarit Caregiver Interview for Alzheimer's Disease (ZCI-AD) Scale Score

End point description:

The ZCI-AD is a modified version of the Zarit Burden Interview, which was originally designed to reflect the stresses experienced by caregivers of people with dementia. This modified version includes slight modifications in item and title wording (e.g., removal of "your relative" to refer directly to the patient, removal of "burden" from title) and the use of 11-point numerical rating scales. The ZCI-AD scale consists of a total of 30 items. Total scores will be calculated with a total score range from 0 to 300 (higher scores indicate a higher burden on the caregiver). The difference in mean change from Baseline to Week 105 between Crenezumab and Placebo treated subjects was estimated. Mixed model repeated measures (MMRMs) adjusting for disease severity, APOEe4 status, geographic region, and the use or non-use of anti-dementia medications at baseline were used to estimate the mean change from baseline.

Secondary: EQ-5D Questionnaire Domain Score for Subjects

End point title	EQ-5D Questionnaire Domain Score for Subjects

End point description:

The EQ-5D is a standardized measure of health status designed to provide a simple generic measure of health for clinical and economic appraisal. It is broadly applicable across a wide range of health conditions and treatment. The EQ-5D assesses five domains to provide a health state index. These are anxiety/depression, pain/discomfort, usual activities, mobility, and self-care. The scores on the EQ-5D ranges from 0 (worst imaginable health state) to 100 (best imaginable health state). The difference in mean change from Baseline to Week 105 between Crenezumab and Placebo treated subjects was estimated. Mixed model repeated measures (MMRMs) adjusting for disease severity, APOEe4 status, geographic region, and the use or non-use of anti-dementia medications at baseline were used to estimate the mean change from baseline. Data presented below is only for subjects that were included in the actual analysis.

Secondary: Percentage of Subjects with Adverse Event (AEs) and Serious Adverse Event (SAEs)

End point title	Percentage of Subjects with Adverse Event (AEs) and Serious Adverse Event (SAEs)

End point description:

An Adverse Event is any untoward medical occurrence in a subject administered a pharmaceutical product and which does not necessarily have to have a causal relationship with the treatment. An adverse event can therefore be any unfavorable and unintended sign (including an abnormal laboratory finding, for example), symptom, or disease temporally associated with the use of a pharmaceutical product, whether or not considered related to the pharmaceutical product. Preexisting conditions which worsen during a study are also considered as adverse events.

End point type	Secondary

Secondary: Percentage of Subjects with Anti-Crenezumab Antibodies

End point title	Percentage of Subjects with Anti-Crenezumab Antibodies

End point description:

Subjects were considered positive or negative for ADA based on their baseline and post-baseline sample results. The number and percentage of subjects with confirmed positive ADA levels were determined for Crenezumab and Placebo groups. The prevalence of ADA at baseline was calculated as the proportion of subjects with confirmed positive ADA levels at baseline relative to the total number of subjects with a sample available at baseline. The incidence of treatment-emergent ADAs was determined as the proportion of subjects with confirmed post-baseline positive ADAs relative to the total number of subjects that had at least one post-baseline sample available for ADA analysis. Data below is only for subjects included in the actual analysis. (Pla = X; Cre = X) represents number of subjects analysed at each timepoint for both arms.

Secondary: Serum Concentration of Crenezumab

End point title	Serum Concentration of Crenezumab[7]

End point description:

Serum concentration data for Crenezumab will be tabulated and summarized. Descriptive summary statistics will include the arithmetic mean and SD. Since a sparse PK sampling design is being used, population (non-linear mixed-effects) modeling will be used to analyze the dose concentration-time data of crenezumab. Information from other clinical studies may be incorporated to establish the PK model. The PK Analysis population was defined as all subjects who have received at least one dose of crenezumab and with at least one evaluable post-dose PK sample. Please note that Post-dose samples were not collected at Weeks 37 and 105. Data presented below is only for subjects that were included in the actual analysis. 999 = Not Estimable. (n = X) refers to Number of Subjects analysed at each timepoint.

End point type	Secondary

End point timeframe:

Pre-infusion (0 hour), 60-90 minutes post-infusion on Day 1 Week 1 and on Week 25; Weeks 13, 37 (Pre-dose), 53, 77 and 105 (infusion length = as per the Pharmacy Manual)

Notes:

[7] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period.
Justification: PK Analysis was only conducted on the Crenezumab treatment group and so data for Placebo was not reported.

End point values	Crenezumab			
Subject group type	Reporting group			
Number of subjects analysed	392			
Units: ug/mL				
arithmetic mean (standard deviation)				
Week 1 Day 1 Predose (n = 392)	999 (± 999)
