

Clinical trial results:

A randomised, double-blind, placebo-controlled, parallel-design, multi-centre study to investigate the efficacy to reduce chemotherapy-induced neutropenia (CIN), effects on the haematopoietic system, safety and pharmacokinetics of Myelo001 in patients receiving adjuvant or neoadjuvant chemotherapy for the treatment of breast cancer

Summary

EudraCT number	2015-003610-25
Trial protocol	DE
Global end of trial date	20 November 2017

Results information

Result version number	v1 (current)
This version publication date	05 December 2018
First version publication date	05 December 2018

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	20 November 2017
Is this the analysis of the primary completion data?	Yes
Primary completion date	25 October 2017
Global end of trial reached?	Yes
Global end of trial date	20 November 2017
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

To assess the efficacy of repeated doses of Myelo001 100 mg tablets taken once per day (QD) per os (p.o.) to reduce chemotherapy induced neutropenia (CIN) in patients receiving chemotherapy for the treatment of breast cancer

Protection of trial subjects:

This study was conducted in accordance with the ethical principles that have their origin in the Declaration of Helsinki (2008) and that are consistent with International Conference on Harmonisation (ICH) Good Clinical Practice (GCP) guidelines (ICH E6) and applicable local regulatory requirements and laws.

The clinical study protocol and informed consent forms were reviewed and approved by an Independent Ethics Committee (IEC).

Safety assessments used in this study included standard measurements that are used routinely in clinical studies of investigational drugs, such as assessment of AEs, physical examinations, vital signs, ECGs, and clinical laboratory evaluations.

A Data Safety Monitoring Board (DSMB) evaluated patients' safety in scheduled intervals.

Background therapy:

Neoadjuvant or adjuvant standard of care poly-chemotherapy regimen containing anthracyclines in combination with cyclophosphamide (CP) defined as EC standard regimen (with or without treatment with taxanes afterwards) served as inclusion criterion. The EC standard regimen the patient needed to be assigned for prior to being informed about the trial was Epirubicin (E) combined with CP: Epirubicin 90 mg/m² BSA (body surface area) + CP 600 mg/m² BSA q21d (every 21 days). Permitted taxane treatments after EC standard regime were paclitaxel (P) and docetaxel (D).

Evidence for comparator:

In this phase 2a trial, Myelo001 was compared to placebo only.

Actual start date of recruitment	01 March 2016
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Germany: 137
Worldwide total number of subjects	137
EEA total number of subjects	137

Notes:

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	108
From 65 to 84 years	29
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

The trial was conducted at multiple trial sites in Germany. Patients were recruited from March 2016 to September 2017.

Pre-assignment

Screening details:

145 patients consented to participate. 1 patient withdraw consent prior to screening. 3 patients were not eligible to participate in the study, because inclusion criterion 8 was not met (Haematologic, laboratory and chemistry thresholds at baseline). 4 patients declined participation in the study after screening. 137 patients were enrolled.

Period 1

Period 1 title	overall trial (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Monitor, Carer

Arms

Are arms mutually exclusive?	Yes
Arm title	Myelo001

Arm description:

Patients received Myelo001 (100 mg) once daily orally for scheduled 23 days from 5 days prior to the first chemotherapy cycle until 3 days prior to the second chemotherapy cycle (epirubicin/cyclophosphamide).

The first batch of the investigational medicinal product (IMP) was exchanged with an exchange IMP batch after 49 patients were randomized.

Altogether, 67 patients were treated with Myelo001. Of these, 26 patients were treated with Myelo001 tablets (#216) of the initial IMP batch and are referred in post-hoc analyses as subgroup Myelo001 IMP Batch 1. The other 41 patients were treated with Myelo001 tablets (#416) of the exchange IMP batch and are referred as subgroup Myelo001 IMP Batch 2.

After no positive treatment effect was evident from the main study results (per protocol set: 65 patients treated with Myelo001), the sponsor authorized further statistical analyses of the effects of the two sets of batches.

The statistical analyses were identical for main and subgroups.

Arm type	Experimental
Investigational medicinal product name	Myelo001 tablet (100 mg)
Investigational medicinal product code	
Other name	Imidazolyl ethanamide pentandioic acid, Vitaglutam, Dicarbamin, Dicarbamine
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

Patients took Myelo001 (100 mg), one tablet orally daily around the same time in the morning. Intake started 5 days prior to the first chemotherapy treatment cycle and was continued until 3 days prior to the second chemotherapy cycle. Based on the standard schedule of the epirubicin/cyclophosphamide chemotherapy selected for this trial, investigational medicinal product intake was 23 days. If the start of the second chemotherapy cycle was delayed, the investigator could decide to prolong Myelo001 treatment to a maximum intake duration of 28 days.

Arm title	Placebo
------------------	---------

Arm description:

Patients received matching placebo once daily orally for scheduled 23 days from 5 days prior to the first chemotherapy cycle until 3 days prior to the second chemotherapy cycle (epirubicin/cyclophosphamide). The first batch of the investigational medicinal product (IMP) was exchanged with an exchange IMP batch after 49 patients were randomized.

Altogether, 67 patients were treated with placebo. Of these, 23 patients were treated with placebo tablets (#116) of the initial IMP batch and are referred in post-hoc analyses as subgroup Placebo IMP Batch 1. The other 44 patients were treated with placebo tablets (#316) of the exchange IMP batch and are referred as subgroup Placebo IMP Batch 2.

After no positive treatment effect was evident from the main study results (per protocol set: 65 patients treated with placebo), the sponsor authorized further statistical analyses of the effects of the two sets of batches.

The statistical analyses were identical for main and subgroups.

Arm type	Placebo
Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

Patients took matching placebo, one tablet orally daily around the same time in the morning. Intake started 5 days prior to the first chemotherapy treatment cycle and was continued until 3 days prior to the second chemotherapy cycle. Based on the standard schedule of the epirubicin/cyclophosphamide chemotherapy selected for this trial, investigational medicinal product (IMP) intake was 23 days. If the start of the second chemotherapy cycle was delayed, the investigator could decide to prolong IMP intake to a maximum intake duration of 28 days.

Statistical analysis description:

Analysis-of-covariance model (ANCOVA) with treatment and region as fixed effects and baseline (before first IMP or placebo administration) lymphocyte counts as covariate. Point estimates (LS Means) were calculated for each treatment group and a two-sided 95% confidence interval based on the t-distribution and the residual error of the model was computed for the difference between treatment means

(Myelo001 minus placebo).

Comparison groups	Placebo v Myelo001
Number of subjects included in analysis	130

Adverse events

Adverse events information

Timeframe for reporting adverse events:

Visit 1 (Screening visit) up to the start of the application of the third chemotherapy cycle, i.e. until Visit 12 (End-of-study visit).

Adverse event reporting additional description:

134 patients were included into the safety analysis set (SAS). During the full trial period, in total 1014 adverse events were reported for the patients of the SAS. Of the adverse event total, 684 (67.5%) were assessed by the investigators as toxicity event related to the background treatment with anti-cancer chemotherapy drugs.

Assessment type	Systematic

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
12 July 2016	<p>In the process of implementing the clinical trial a few changes to the protocol became necessary to add precision and facilitate the per protocol conduct of the trial. The overall trial design remained unchanged.</p> <p>Notable changes included:</p> <ul style="list-style-type: none">• Permission to draw the blood sample a day earlier for baseline assessment and urine pregnancy testing as an alternative to analysis in serum• Change of visit schedule allowing shifts by +/- 1 day for certain study visits• Permission to substitute the baseline serum pregnancy test for an equivalent urine pregnancy test (local lab only)• Clarification that the use of (low-dose) dexamethasone for antiemetic use does not fall under the exclusion criteria and definition of maximum dose to achieve an equilibrium of the hematopoietic influence of dexamethasone• Adjustment of laboratory sample volumes to maximum amounts required by the two permitted systems• Consistency in the text that adverse events are followed up from first (screening) to last visit (EOS)
17 August 2017	<p>Changes are mainly related to the statistical analyses and endpoint section. No procedure for the patient or investigators were changed. The most important changes include:</p> <ul style="list-style-type: none">• Revision of primary endpoint(s): Two co-primary endpoints were added• Revision of primary statistical test procedure• Addition of secondary endpoints• Sample size adjustment based on revised statistical procedure• Revised definition of the analysis sets (Revised Full Analysis Set and Per Protocol Set) <p>Importantly, all protocol changes did not entail any procedural or interventional changes, but deepen or expand the analysis of the data generated from existing study procedures.</p>

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
