## Results analysis stage

Analysis stage	Final
Date of interim/final analysis	30 June 2019
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	30 June 2019
Was the trial ended prematurely?	Yes

Notes:

---

## General information about the trial

Main objective of the trial:

The aim of this research is to compare three different preanesthetic medications (midazolam, clonidine and dexmedetomidine) in elective minor surgery under total intravenous anesthesia in pediatric patients for anxiolysis and sedation, hemodynamic stability and recovery profiles.

Protection of trial subjects:

The trial was conducted in the normal perioperative pediatric flow at the hospital to ensure a close monitoring of the child while acute effects of the IMPs were studied. One parent was present with the child until the child was anesthetized in the operation theatre. During the preanesthetic phase there was a registered nurse present in the same room until the registered anesthetic nurse (RNA) brought the child and the parent to the operation theatre. During induction of anesthesia and until being delivered to the postoperative ward, and anesthesiologist (registered specialist physician) and the RNA was present all the time. At the postoperative ward a registered nurse attended the needs of the child in addition to having the parent present.

For unexpected long-term effects after the child had left the hospital and the acute effect of the premedication (IMP) was undetectable, the parent had access to a study-telephone number in addition to being able to contact the surgeon or the emergency ward. Information about the trial was added to the patients electronic health registry (chart) and a procedure for breaking the code for the individual patient by opening a sealed envelope was in place 24/7/365 if it would have been necessary. The decision to break the code was left at the discretion of the attending at the intensive care unit of the hospital.

Background therapy:

Preoperative lidocain/prilocain local cream 20 mg/g, 2g, paracetamol 30 mg/kg, ibuprofen oral solution 10 mg/kg, betamethasone, 0.3 mg/kg.

Anesthesia with atropine 0.01 mg/kg iv, propofol and remifentanyl infusion.

Postoperative iv morphine 0.1-0.2 mg/kg and ondansetron 0.1 mg/kg.

Evidence for comparator:

The comparators were three groups receiving oral midazolam, oral clonidine or intranasal dexmedetomidine as preanesthetic medication. Oral dexmedetomidine was not preferred because of poor bioavailability. Results from clinical trials in children, suggests that intranasal administration of dexmedetomidine is more effective as premedication, with adequate sedation achieved within 30 to 45 minutes (Cimen, Hanci, Sivrikaya, Kilinc, & Erol, n.d.; Zhang, Bai, Zhang, Wang, & Lu, 2013). Using oral preanesthetic, onset of sedation is significantly faster after premedication with oral midazolam (30 min) than with oral clonidine (60 min) (Almenrader, Passariello, Coccetti, Haiberger, & Pietropaoli, 2007).

The compared premedications are oral midazolam 0.5 mg/kg, oral clonidine 4 µg/kg, and intranasal dexmedetomidine 2 µg/kg. These products are used "off label" as clinical routine in hospitals in Sweden and worldwide for sedation to children undergoing procedures. Course of therapy are current regimens, tested and recommended in clinical studies and by the Medical Products Agency (Almenrader et al., 2007; Cimen, Hanci, Sivrikaya, Kilinc, & Erol, n.d.; Zhang, Bai, Zhang, Wang, & Lu, 2013).

Actual start date of recruitment	01 February 2017
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

---

### Population of trial subjects

---

#### Subjects enrolled per country

---

Country: Number of subjects enrolled	Sweden: 90
Worldwide total number of subjects	90
EEA total number of subjects	90

Notes:

---

#### Subjects enrolled per age group

---

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	90
Adolescents (12-17 years)	0
Adults (18-64 years)	0
From 65 to 84 years	0
85 years and over	0

## Subject disposition

### Recruitment

Recruitment details:

The study took place in Region Norrbotten, Sweden. Patients were recruited between February 1, 2017 and May 6, 2017.

### Pre-assignment

Screening details:

In total, 239 patients aged 2-6 years and planned for ENT surgery were assessed for eligibility. Due to shortness of research staff on the day of surgery (n=199), declined to participate (n=4), not meeting inclusion criteria (n=49) or being removed from the operation program (n=5), only 90 patients were randomized.

### Period 1

Period 1 title	Perioperative period (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Monitor, Data analyst, Carer, Assessor

Blinding implementation details:

A separate nurse, not involved in any of the other roles, performed the randomization by opening a sealed envelope, preparing and giving the three doses: two placebos and one with an active substance.

### Arms

Are arms mutually exclusive?	Yes
<b>Arm title</b>	CLO group

Arm description:

Children who received clonidine 4 µg/kg oral solution 60 min before going to surgery

Arm type	Active comparator
Investigational medicinal product name	Clonidine
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Concentrate for oral solution
Routes of administration	Enteral use

Dosage and administration details:

Clonidine APL, oral solution 20 µg/ml, 4 µg/kg (0.2 ml/kg), given per os 60 min before going to surgery

<b>Arm title</b>	MID group
------------------	-----------

Arm description:

Children who received midazolam 0.5mg/kg oral solution 40 min before going to surgery

Arm type	Active comparator
Investigational medicinal product name	Midazolam
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Concentrate for oral solution
Routes of administration	Enteral use

Dosage and administration details:

Clonidine APL, oral solution 1 mg/ml, 0.5 mg/kg (0.5 ml/kg), given per os 40 min before going to surgery

<b>Arm title</b>	DEX group
------------------	-----------

Arm description:

Children who received dexmedetomidine 2 µg/kg intranasal 40 min before going to surgery

Arm type	Active comparator
----------	-------------------

Investigational medicinal product name	Dexmedetomidine
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Concentrate and solvent for solution for injection/infusion
Routes of administration	Intranasal use

Dosage and administration details:

Dexmedetomidine, 100 µg/ml, 2 µg/kg, 0.2 ml/kg (0.02 ml/kg) was given intranasally with a mucosal atomizing device (

<https://www.teleflex.com/emea/en/product-areas/anaesthesia/atomization/mad-nasal-atomization-device/index.html>) 40 min before going to surgery

<b>Number of subjects in period 1</b>	CLO group	MID group	DEX group
Started	30	30	30
Completed	26	27	30
Not completed	4	3	0
Refused to take IMP	3	3	-
Protocol deviation	1	-	-

## Baseline characteristics

### Reporting groups

Reporting group title	Perioperative period

Number of subjects analysed	27	27	30	
Units: RSS				
median (full range (min-max))	3 (2 to 5)	2 (2 to 3)	4 (2 to 5)	

### Statistical analyses

Statistical analysis title	RSS at anesthesia preparation
Comparison groups	CLO group v DEX group v MID group

Number of subjects included in analysis	84
Analysis specification	Pre-specified
Analysis type	equivalence
P-value	< 0.001
Method	Kruskal-wallis

### Secondary: Time to recover from anesthesia and surgery

End point title	Time to recover from anesthesia and surgery
End point description: Time to recover from anaesthesia and surgery defined as the time from arrival at the PACU until the criteria of discharge from PACU was reached using the Post Anesthesia Scoring System (PADSS)	
End point type	Secondary
End point timeframe: First few hours after anesthesia	

End point values	CLO group	MID group	DEX group	
Subject group type	Reporting group	Reporting group	Reporting group	
Number of subjects analysed	26	26	30	
Units: minutes				
median (full range (min-max))	90 (38 to 162)	76 (45 to 150)	105 (60 to 325)	

### Statistical analyses

Statistical analysis title	Time until discharge criteria fulfilled
Statistical analysis description: Kruskal-Wallis for the time until the discharge criteria were fulfilled, comparing the three arms.	
Comparison groups	CLO group v MID group v DEX group
Number of subjects included in analysis	82
Analysis specification	Pre-specified
Analysis type	equivalence
P-value	= 0.211 <sup>[3]</sup>
Method	Kruskal-wallis

Notes:

[3] - No difference detected in time to full recovery from anesthesia between the groups

### Secondary: Emergence delirium

End point title	Emergence delirium
End point description: PAED score ≥10p	
End point type	Secondary
End point timeframe: The time period at the postoperative ward until being discharged	

<b>End point values</b>	CLO group	MID group	DEX group	
Subject group type	Reporting group	Reporting group	Reporting group	
Number of subjects analysed	26	26	30	
Units: PAED > 10p	3	8	1	

## Statistical analyses

<b>Statistical analysis title</b>	Emergence delirium
Statistical analysis description:	
Emergence delirium at any timepoint, defined as PAES score >10p	
Comparison groups	CLO group v MID group v DEX group
Number of subjects included in analysis	82
Analysis specification	Pre-specified
Analysis type	equivalence
P-value	= 0.013 <sup>[4]</sup>
Method	Chi-squared

Notes:

[4] - The three premedications are likely to cause different proportions of children with emergence delirium after premedication + anesthesia with total intravenous anesthesia (propofol + remifentanyl)

## Adverse events

## More information

### Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? No

---

### Interruptions (globally)

Were there any global interruptions to the trial? No

### Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

An interim analysis was performed after 90 included participants without breaking the code. The variance within the groups in the primary objective was smaller than expected, and the intended power had been reached. Thus the study was closed.
