**Title**

Effects of postoperative palonosetron in ambulatory patients identified with high risk for postdischarge nausea and vomiting (PDNV) – a randomized controlled trial with comparison to placebo.

Due to the pandemic, no resources have been available to analyze the data in the study until May 2021. Data cleaning is now finished and the process with analyzing the data will start. The randomization is still blinded and we plan to unblind the data during aug/sept 2021. Results from the study will be posted late 2021 or early 2022.
