

Clinical trial results:

An open-label, behavioral-treatment-controlled evaluation of the effects of extended release methylphenidate (Ritalin® LA) on the frequency of cytogenetic abnormalities in children 6 – 12 years of age with attention deficit hyperactivity disorder (ADHD) followed by an observation phase up to 24-months

Summary

EudraCT number	2015-004444-19
Trial protocol	Outside EU/EEA
Global end of trial date	05 March 2008

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	Yes

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	05 March 2008
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	05 March 2008
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The primary objective was to compare the frequency of chromosomal abnormalities (chromosomal aberrations per 100 cells excluding gaps and micronuclei per 1000 binucleated cells) before and after three months of treatment with Ritalin® LA (extended release MPH) and behavioral treatment, compared to behavioral treatment alone.

Protection of trial subjects:

The study was in compliance with the ethical principles derived from the Declaration of Helsinki and in compliance with all International Conference on Harmonization (ICH) Good Clinical Practice (GCP) Guidelines. All the local regulatory requirements pertinent to safety of trial subjects were followed.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	14 November 2006
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	United States: 109
Worldwide total number of subjects	109
EEA total number of subjects	0

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	104
Adolescents (12-17 years)	5
Adults (18-64 years)	0
From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details: -

Pre-assignment

Screening details:

A total of 142 participants were screened for the study but only 109 were randomized to treatment

Period 1

Period 1 title	Treatment
Is this the baseline period?	Yes
Allocation method	Non-randomised - controlled
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
Arm title	Ritalin LA Plus Behavior Therapy

Arm description:

10-60 mg/day

Arm type	Experimental
Investigational medicinal product name	methylphenidate
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Capsule
Routes of administration	Oral use

Dosage and administration details:

10 mg/day to 60 mg/day

Arm title	Behavior Therapy
------------------	------------------

Arm description:

Primary: The number of chromosomal aberrations per 100 cells excluding gaps at baseline and at the end of treatment i.e day 84 (week 12)

End point title	The number of chromosomal aberrations per 100 cells excluding gaps at baseline and at the end of treatment i.e day 84 (week 12)
End point description:	
The number of chromosomal aberrations per 100 cells excluding gaps at Baseline (n=33, n=32) and at Week 12 (n=33, n=32) was counted in blood samples cultured for 48 hours using a standard protocol. The types of abnormalities included translocations (reciprocal and non-reciprocal), insertions, dicentric, fragments, inversions, chromatid exchanges (quadriradials and triradials), breaks, and other unusual observations, eg, aneuploidy, tetraploidy or endoreduplication.	
End point type	Primary
End point timeframe:	
baseline and at end of treatment (Week 12)	

End point values	Ritalin LA plus behavior therapy	Behavior therapy		
Subject group type	Subject analysis set	Subject analysis set		
Number of subjects analysed	52	52		
Units: number of abnormalities				
least squares mean (standard error)				
Baseline	0.6 (± 0.24)	0.44 (± 0.14)		
At the end of treatment i.e. week12:	0.63 (± 0.07)	0.74 (± 0.11)		
Mean				

Statistical analyses

Statistical analysis title	Ratio of Day 84 (Week 12) to Baseline
Statistical analysis description:	
Inferential analysis of change from baseline reported in least square means for cytogenetic endpoints by visit by treatment	
Comparison groups	Ritalin LA plus behavior therapy v Behavior therapy
Number of subjects included in analysis	104
Analysis specification	Pre-specified
Analysis type	other ^[1]
Parameter estimate	Poisson model
Point estimate	1.34
Confidence interval	
level	95 %
sides	2-sided
lower limit	0.53
upper limit	3.4
Variability estimate	Standard error of the mean
Dispersion value	0.64

Notes:

[1] - Ratio less than 1 indicates a decrease from Baseline to Day 84 (Week 12). Least squares means of the ratio of Day 84 (Week 12) to Baseline in either group were estimated by a Poisson model using GEE estimation techniques that included factors for time, treatment by time interaction, sex and age group as covariates.

Primary: The Number of Micronuclei per 1000 Binucleated Cells Endpoints at Baseline and at the End of Treatment i.e Day 84 (Week 12)

End point title	The Number of Micronuclei per 1000 Binucleated Cells Endpoints at Baseline and at the End of Treatment i.e Day 84 (Week 12) ^[2]
-----------------	--

End point description:

The number of micronuclei per 1000 binucleated cells was measured at Baseline (n=34 , n=29) and at the end of treatment, Week 12 (n =34, n= 29), in blood cultured for 48 hours using a standard protocol.

End point type	Primary
----------------	---------

End point timeframe:

baseline and at end of treatment (Week 12)

Notes:

[2] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: Only summary analysis performed per groups

Secondary: Change from baseline to end of treatment (Week 12) on the Conners' ADHD/DSM-IV Scale for Parents (CADS-P)

End point title	Change from baseline to end of treatment (Week 12) on the Conners' ADHD/DSM-IV Scale for Parents (CADS-P)
-----------------	---

End point description:

Parents completed the Conners' ADHD/DSM-IV Scale for Parents (CADS-P) consisting of the ADHD Index (12 items) and the Diagnostic and Statistical Manual of Mental Disorders, Fourth Edition (DSM-IV) (18 items). Parents rated their child's behavior of the previous week from a list of common problems. When asked "How much of a problem has this been in the last week?" parents selected 0 = none, not at all, seldom, or very infrequently; 3 = very much true, or it occurs very often or frequently; or 1 or 2 for ratings in between. A score of 50 is considered normal and more than 70 markedly atypical.

End point type	Secondary

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
03 October 2006	<p>To separate the efficacy assessment of the two treatment arms and specify the parameters to be analyzed</p> <ul style="list-style-type: none">• To add an additional efficacy questionnaire (SDQ) to the study as exploratory objective• To add GGT to the exclusion criteria• To define the age for the stratification groups• To clarify the different study phases with the different phase- and study-completion visits• To allow patients with co-morbid Oppositional Defiant Disorder (ODD) and with nonsevere Conduct Disorder (CD) into the study• To align the names of the assessments with the names of the corresponding CRF pages and add missing ones to the assessment table• To add and clarify some assessment time-points• To correct the fact that the study data are recorded on paper CRF and not on electronic CRF• To add explanation of the ECG assessments• To correct the strengths of the investigational drug to be dispensed• To add further clarifications to the analysis• To correct that patients, who show chromosomal changes will be followed until it can be determined whether their health is affected• To expand the behavior therapy
22 February 2007	<p>The main purpose of this amendment was to include an observation-phase to follow up those patients who finished the core study 2201 before the last patient was completed. This amendment was designed to obtain additional data concerning potential cytogenetic changes and concurrent medical, social and environmental factors in these patients. These amendments (both before database lock) were not felt to affect the interpretation of study results, as the changes were minor, and occurred at a time when all centers were still recruiting patients into both treatment groups.</p>
23 January 2008	<p>The main purpose of this amendment was to reflect the manner in which cytogenetic data are typically presented in the peer-reviewed literature (Koppen et al, 2007; Lazutka et al. 1999; El-Zein et al, 2005; Neri et al, 2005; Walitza et al, 2007), the final results would be reported as the "number of chromosomal aberrations per 100 cells excluding gaps", and the "number of micronuclei per 1000 binucleated cells". No change was made to sister chromatid exchanges. This amended approach recognized the relatively infrequent cells that contain more than one abnormal event. The actual difference in the means between the two approaches was expected to be modest and probably not biologically meaningful. However, this amended approach was more scientifically accurate. An interim analysis confirmed that the power of the sample size calculation based on number of abnormal events per number of cells (ie: number of CAs/200 cells, number of MNs/2000 binucleated cells) was similar compared to the original calculation, that was based on the number of cells with aberrations.</p>

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

Since no cytogenetic effects were observed, blood samples were not analyzed for pharmacokinetics/pharmacodynamics.
--

Notes:
