

Clinical trial results:

Sodium-glucose CO-transporter inhibition in patients with newly detected Glucose Abnormalities post Myocardial Infarction (SOCOGAMI)

Summary

EudraCT number	2015-004571-73
Trial protocol	SE
Global end of trial date	25 November 2020

Results information

Result version number	v1 (current)
This version publication date	27 April 2023
First version publication date	27 April 2023

Trial information

Trial identification

Sponsor protocol code	SOCOGAMI
-----------------------	----------

Additional study identifiers

ISRCTN number	-
ClinicalTrials.gov id (NCT number)	-
WHO universal trial number (UTN)	-

Notes:

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	01 November 2022
Is this the analysis of the primary completion data?	Yes
Primary completion date	25 November 2020
Global end of trial reached?	Yes
Global end of trial date	25 November 2020
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

To test the hypotheses that Empagliflozin (Jardiance®) will have a beneficial effect on myocardial function and structure, glucose homeostasis and beta cell function in patients with recent myocardial infarction or unstable angina pectoris and newly detected impaired glucose tolerance or type 2 diabetes.

Protection of trial subjects:

All patients signed consent to study participation following written and oral information. The trial was carried out in compliance with principles in the Declaration of Helsinki, 1996 version, in accordance with the ICH Harmonized Tripartite Guideline for Good Clinical Practice (GCP) and in accordance with applicable regulatory requirements. The protocol was approved by the Regional Ethics committee in Stockholm (Dnr 2015:4/11).

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	02 June 2016
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Sweden: 42
Worldwide total number of subjects	42
EEA total number of subjects	42

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	11
From 65 to 84 years	31

85 years and over	0
-------------------	---

Subject disposition

Recruitment

Recruitment details:

Patients aged > 18 years, who during the previous six months suffered AMI or unstable angina pectoris were recruited. 55 patients were screened, 13 didn't meet the inclusion criterias, and 42 patients were included.

Pre-assignment

Screening details:

Inclusion criteria: patients aged >18 years, who during the previous six months suffered AMI or unstable angina pectoris were recruited if they, had newly detected IGT or T2DM confirmed by two screening oral glucose tolerance tests (OGTT).

Exclusion criteria: known diabetes, contraindications to CMR imaging, eGFR < 30 ml/min/1.73 m²; and more.

Period 1

Period 1 title	Overall trial (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator

Arms

Are arms mutually exclusive?	Yes
Arm title	Placebo

Arm description:

Patients in placebo arm were randomized to 25 mg of corresponding placebo. They received a patient diary, equipment for and instruction on self-monitoring of glucose levels and were seen at the outpatient clinic one and three months later. Seven months after randomization all investigations performed during the baseline visit were repeated. Thereafter the study drug was discharged. Ten months after randomization the patient returned for a final visit, during which all investigations were repeated once more.

Arm type	Placebo
Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

Patients in placebo arm were randomized to 25 mg of placebo daily. After 7 months the study drug was discharged.

Arm title	Empagliflozin
------------------	---------------

Arm description:

Patients in Empagliflozin arm were randomized to 25 mg Empagliflozin daily. They received a patient diary, equipment for and instruction on self-monitoring of glucose levels and were seen at the outpatient clinic one and three months later. Seven months after randomization all investigations performed during the baseline visit were repeated. Thereafter the study drug was discharged. Ten months after randomization the patient returned for a final visit, during which all investigations were repeated once more.

Arm type	Experimental
Investigational medicinal product name	Empagliflozin
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Film-coated tablet
Routes of administration	Oral use

Dosage and administration details:

Patients in Empagliflozin arm were randomized to 25 mg of Empagliflozin daily. After 7 months the study drug was discharged.

Number of subjects in period 1	Placebo	Empagliflozin
Started	22	20
Completed	22	20

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? No

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

A weakness may be the limited number of patients, but it is unlikely that the inclusion of further study participants of the same kind would have changed the results.
