

Clinical trial results:

The Evaluation of Lamictal as an Add-on Treatment for Bipolar I Disorder in Children and Adolescents, 10 to 17 Years of Age

Summary

EudraCT number	2015-004872-31
Trial protocol	Outside EU/EEA
Global end of trial date	07 August 2013

Results information

Result version number	v1 (current)
This version publication date	22 January 2017
First version publication date	22 January 2017

Trial information

Trial identification

Sponsor protocol code	SCA102833

Notes:

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	Yes

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	29 January 2014
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	07 August 2013
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

TBD

Protection of trial subjects:

Not Applicable

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	31 July 2008
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	United States: 301
Worldwide total number of subjects	301
EEA total number of subjects	0

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	74
Adolescents (12-17 years)	227
Adults (18-64 years)	0
From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

A total of 301 participants were enrolled in the study, of which 298 subjects took at least one dose of lamotrigine (LTG). One hundred and seventy three participants met stabilization criteria and entered the Randomized Phase.

Pre-assignment

Screening details:

The study consisted of a 2-week Screening Phase, an 18-week Open-Label Phase, a 36-week Double-Blind Randomized Phase and a Taper and Follow-up Phase (up to 4 weeks depending on the dose the participant was taking at the last Open-Label or Randomized Phase visit), which was either open-label or double-blind depending on the phase of the study.

Period 1

Period 1 title	Open-Label Phase
Is this the baseline period?	No
Allocation method	Non-randomised - controlled
Blinding used	Not blinded

Arms

Arm title	LTG: Open-Label Phase
-----------	-----------------------

Arm description:

Participants (par.) received lamotrigine (LTG) up to a maximum dose depending on their age and concomitant bipolar medication group. Participants 10 -12 years of age received LTG up to a maximum dose of: 3 milligrams/kilograms (mg/kg)/day or 100 mg/day, whichever was less; or 6 mg/kg/day or 200 mg/day whichever was less; or 12 mg/kg/day or 300 mg/day whichever was less, depending on their bipolar medication group. Participants 13-17 years of age received LTG up to a maximum dose of 150 mg/day, 300 mg/day, or 400 mg/day depending on their bipolar medication group. Participants took LTG for a duration of up to 18 weeks.

Arm type	Experimental
Investigational medicinal product name	Lamictal (Lamotrigine) 5, 25, 100 mg
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Chewable/dispersible tablet
Routes of administration	Oral use

Dosage and administration details:

Participants 10 -12 years of age received LTG up to a maximum dose of: 3 milligrams/kilograms (mg/kg)/day or 100 mg/day, whichever was less; or 6 mg/kg/day or 200 mg/day whichever was less; or 12 mg/kg/day or 300 mg/day whichever was less, depending on their bipolar medication group. Participants 13-17 years of age received LTG up to a maximum dose of 150 mg/day, 300 mg/day, or 400 mg/day depending on their bipolar medication group. Participants took LTG for a duration of up to 18 weeks

Number of subjects in period 1	LTG: Open-Label Phase
Started	298
Completed	173
Not completed	125
Consent withdrawn by subject	37
Physician decision	2

Adverse event, non-fatal	26
Lost to follow-up	7
Lack of efficacy	18
Protocol deviation	35

Period 2

Period 2 title	Randomized Phase
Is this the baseline period?	Yes ^[1]
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator

Arms

Are arms mutually exclusive?	Yes
Arm title	Placebo

Arm description:

Participants received matching placebo in the evening for participants taking one dose and for participants taking two divided doses, one dose in the morning and one dose in the evening, for a duration of up to 36 weeks.

Arm type	Placebo
Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Chewable/dispersible tablet
Routes of administration	Oral use

Dosage and administration details:

Participants received matching placebo in the evening for participants taking one dose and for participants taking two divided doses, one dose in the morning and one dose in the evening, for a duration of up to 36 weeks.

Arm title	Lamotrigine
------------------	-------------

Arm description:

Participants received LTG equivalent to the dose established in the Open-Label Phase. Participants received LTG tablets in the evening for participants taking one dose and for participants taking two divided doses, one dose in the morning and one dose in the evening, for a duration of up to 36 weeks.

Arm type	Experimental
Investigational medicinal product name	Lamotrigine
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Chewable/dispersible tablet
Routes of administration	Oral use

Dosage and administration details:

Participants received LTG equivalent to the dose established in the Open-Label Phase . Participants received LTG

Notes:

[1] - Period 1 is not the baseline period. It is expected that period 1 will be the baseline period.

Justification: Participants (par.) received lamotrigine (LTG) up to a maximum dose depending on their age and concomitant bipolar medication group. Participants 10 -12 years of age received LTG up to a maximum dose of: 3 milligrams/kilograms (mg/kg)/day or 100 mg/day, whichever was less; or 6 mg/kg/day or 200 mg/day whichever was less; or 12 mg/kg/day or 300 mg/day whichever was less,

depending on their bipolar medication group. Participants 13-17 years of age received LTG up to a maximum dose of 150 mg/day.

Number of subjects in period 2 ^[2]	Placebo	Lamotrigine
Started	86	87
Completed	21	20
Not completed	65	67
Consent withdrawn by subject	14	22
Physician decision	3	1
Adverse event, non-fatal	26	17
Lost to follow-up	2	3
Lack of efficacy	11	11
Protocol deviation	9	13

Notes:

[2] - The number of subjects reported to be in the baseline period are not the same as the worldwide number enrolled in the trial. It is expected that these numbers will be the same.

Justification: A total of 301 participants were enrolled in the study, of which 298 subjects took at least one dose of lamotrigine (LTG). One hundred and seventy three participants met stabilization criteria and entered the Randomized Phase.

Baseline characteristics

Reporting groups

Reporting group title	Placebo
-----------------------	---------

Reporting group description:

Participants received matching placebo in the evening for participants taking one dose and for participants taking two divided doses, one dose in the morning and one dose in the evening, for a duration of up to 36 weeks.

Reporting group title	Lamotrigine
-----------------------	-------------

Reporting group description:

Participants received LTG equivalent to the dose established in the Open-Label Phase. Participants received LTG tablets in the evening for participants taking one dose and for participants taking two divided doses, one dose in the morning and one dose in the evening, for a duration of up to 36 weeks.

Participants received LTG tablets in the evening for participants taking one dose and for participants taking two divided doses, one dose in the morning and one dose in the evening, for a duration of up to 36 weeks.	

Primary: Time from randomization to the occurrence of a bipolar event (TOBE)

End point title	Time from randomization to the occurrence of a bipolar event (TOBE)
End point description: TOBE is defined as the first prescription of any additional pharmacotherapy to treat bipolar symptoms, increasing the dose(s) of the participants conventional bipolar medication(s), treatment with electroconvulsive therapy, or moving the participant to a more restricted environment for observation, safety, or treatment; or participant withdrawal from the study due to a bipolar-related adverse event (AE) or serious adverse event (SAE); or participants withdrawal from the study due to lack of efficacy as defined by rating scale threshold scores. TOBE is calculated using a log rank test with stratification for index mood state (depression, mania/hypomania, mixed mood). Randomized Intent-to-Treat (ITT) Population: all participants who were randomized to LTG or placebo and received at least one dose of investigational product.	
End point type	Primary
End point timeframe: From randomization until Week 36

Adverse events

Adverse events information

Timeframe for reporting adverse events:

On-treatment serious adverse events (SAEs) and non-serious adverse events (AEs) were collected from the first dose of investigational product until the last visit of the Open-Label or Double-Blind Taper and Follow-up Phase (up to Taper Week 4).

Adverse event reporting additional description:

On-treatment SAEs and non-serious AEs, were reported for ITT population (Open-Label and Randomized Phase), comprised of all participants who were randomized to LTG or placebo (only for Randomized Phase) and received at least one dose of the investigational product.

Assessment type	Systematic

Reporting groups

Reporting group title	Open-Label and Open-Label Taper Phases: LTG
-----------------------	---

Reporting group description:

Participants (par.) received lamotrigine (LTG) up to a maximum dose depending on their age and concomitant bipolar medication group. Participants 10 -12 years of age received LTG up to a maximum dose of : 3 milligrams/kilograms (mg/kg)/day or 100 mg/day, whichever was less; or 6 mg/kg/day or 200 mg/day whichever was less; or 12 mg/kg/day or 300 mg/day whichever was less, depending on their bipolar medication group. Participants 13-17 years of age received LTG up to a maximum dose of 150 mg/day, 300 mg/day, or 400 mg/day depending on their bipolar medication group. Participants took LTG for a duration of up to 18 weeks. Participants discontinuing from the study during the Open-Label Phase entered an open Taper and Follow-up Phase. The Taper and Follow-up Phase may last up to 4 weeks, dependent on the dose of LTG the participant received during the Open-Label Phase.

Reporting group title	Randomized and Double-blind Taper Phases: Placebo
-----------------------	---

Reporting group description:

Participants received matching placebo in the evening for participants taking one dose and for participants taking two divided doses, one dose in the morning and one dose in the evening, for a duration of up to 36 weeks. Participants completing the Randomized Phase entered Double-Blind Taper and Follow-up Phase. The Taper and Follow-up Phase may last up to 4 weeks. The participant received Placebo during this Phase.

Reporting group title	Randomized and Double-blind Taper Phases: LTG
-----------------------	---

Reporting group description:

Participants received LTG equivalent to the dose established in the Open-Label Phase. Participants received LTG tablets in the evening for participants taking one dose and for participants taking two divided doses, one dose in the morning and one dose in the evening, for a duration of up to 36 weeks. Participants completing the Randomized Phase entered Double-Blind Taper and Follow-up Phase. The Taper and Follow-up Phase may last up to 4 weeks, dependent on the dose of LTG the participant received during the Randomized Phase.

Serious adverse events	Open-Label and Open-Label Taper Phases: LTG	Randomized and Double-blind Taper Phases: Placebo	Randomized and Double-blind Taper Phases: LTG
Total subjects affected by serious adverse events

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
11 July 2008	To 1) comply with the FDA's advice to increase the lower weight limit for the 10-12 year old subjects receiving valproate; 2) clarify the mg/kg/day dosing for the 10-12 year-old subjects; 3) add and clarify the laboratory analytes; and 4) specify the availability of laboratory and ECG results prior to randomization
08 March 2009	To 1) Comply with FDA's recommendation to add the Simpson-Angus scale to assess extrapyramidal symptoms; 2) add paliperidone to the list of acceptable bipolar medications; and, 3) to make other minor clarifications throughout the protocol.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
