

Clinical trial results:

**Evaluating different rate control therapies in permanent atrial fibrillation:
A prospective, randomised, open-label, blinded endpoint study
comparing digoxin and beta-blockers as initial rate control therapy.
RAte control Therapy Evaluation in permanent Atrial Fibrillation: RATE-
AF**

Summary

EudraCT number	2015-005043-13
Trial protocol	GB
Global end of trial date	26 February 2020

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	26 February 2020
Is this the analysis of the primary completion data?	Yes
Primary completion date	16 December 2019
Global end of trial reached?	Yes
Global end of trial date	26 February 2020
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

Patient-reported quality of life (QoL), with a predefined focus on physical well-being using the SF-36 (a QoL tool) physical component summary at six months.

Protection of trial subjects:

All sites were provided with the Rate-AF protocol that provided specific instruction relating to inclusion/exclusion criteria and trial patient safety. There was clear instruction relating to trial intervention safety and considerations detailed within the protocol. Rate-AF had a Data Monitoring Committee to monitor patient safety throughout the trial.

Background therapy:

Atrial fibrillation is a common heart rhythm disturbance, causing discomfort for patients, a high risk of stroke, frequent hospital admissions and a two-fold increase in death. The number of patients with this condition are expected to double in the next 20 years. Medications to control heart-rate are used in the majority of patients, although the choice of agent is often guided by local preference rather than evidence from controlled trials. Despite the fact that patients with atrial fibrillation have high rates of other cardiac conditions such as heart failure, clinicians have insufficient evidence to personalise the use of different therapies. This feasibility study allowed us to develop a range of methods that could characterise patients according to the pumping and relaxing function of the heart, the burden of symptoms and to identify new blood markers. In this way, the investigators hoped to improve clinical practice guidelines, allowing doctors to prescribe appropriate treatments for the right patients. The research focused around a randomised trial of two medication strategies, providing much-needed data on the comparison of digoxin and beta-blockers (two commonly-used drugs in patients with atrial fibrillation). It also allowed us to identify the best way to record patient-reported quality of life and develop robust techniques to determine heart function using non-invasive imaging, facilitating the conduct of a large-scale clinical trial. The key objectives of the research programme were to define the optimal medications for patients with atrial fibrillation and identify the most valid, reproducible and cost-effective methods to examine patients. The ultimate aim of the project was to improve clinical outcomes in atrial fibrillation, benefiting patients, the National Health Service and the global community.

Evidence for comparator:

A prospective, randomised, open-label, blinded-endpoint (PROBE) study design. Recruited patients will receive either:

Digoxin- The maintenance dose of oral digoxin will be either 62.5µg or 125µg according to the pre-defined treatment schedule and up titrated, as required, to 250µg daily. A single loading dose of four tablets (250 or 500µg according to target maintenance dose) will be prescribed in digoxin-naïve participants, where necessary OR

Beta-blocker- Oral bisoprolol will be commenced at either 1.25mg, 2.5mg or 5mg according to the treatment schedule and uptitrated, as required, to 15mg daily.

Patients will be followed-up for the duration of treatment.

Actual start date of recruitment	20 December 2016
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	United Kingdom: 161
Worldwide total number of subjects	161
EEA total number of subjects	0

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	15
From 65 to 84 years	117
85 years and over	29

Subject disposition

Recruitment

Recruitment details:

First patient was randomised on the 20th December 2016 and the last patient was randomised on the 01st October 2018. A total of 161 patients were randomised into the Rate-AF Trial across one centre. Patients were equally recruited with 80 patients in the Bisoprolol arm and 81 in the Digoxin arm.

Pre-assignment

Screening details:

A total of 390 were screened for the trial, of these screened 161 were randomised.

Period 1

Period 1 title	Baseline
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Single blind
Roles blinded	Investigator ^[1]

Blinding implementation details:

A prospective, randomised, open-label, blinded endpoint trial comparing digoxin and beta-blockers as initial rate control therapy with investigator blinded endpoint. A prospective, randomised, open-label, blinded-endpoint (PROBE) study design.

Arms

Are arms mutually exclusive?	Yes
Arm title	Digoxin
Arm description: -	
Arm type	Active comparator
Investigational medicinal product name	Digoxin Tablets
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Coated tablet
Routes of administration	Oral use

Dosage and administration details:

Trial maintenance doses will initially be 62.5 or 125 µg orally (at the clinician's discretion, taking into account age and renal function), with planned up-titration to 125/250 µg. The maximum trial dose will be 250 µg daily.

A single loading dose of four tablets (250 or 500 µg according to target maintenance dose) will be prescribed in digoxin-naïve participants. The clinician is permitted to omit the loading dose or prescribe a second, where necessary.

Unblinded serum digoxin concentrations will be assessed at visits 2 and 3, with results reported back to the relevant clinician(s). This process will assist in monitoring compliance, adjusting dosage in cases of low serum levels and avoiding toxicity.

Arm title	Bisoprolol
Arm description: -	
Arm type	Active comparator
Investigational medicinal product name	Bisoprolol
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Film-coated tablet
Routes of administration	Oral use

Dosage and administration details:

Trial starting doses will be 1.25 or 2.5 or 5 mg (at the clinician's discretion), with planned up-titration to 10 mg in increments of 1.25 or 2.5 mg. The maximum trial dose will be 15 mg daily. No loading dose is required.

Notes:

[1] - The roles blinded appear inconsistent with a simple blinded trial.

Justification: Blinding implementation details: A prospective, randomised, open-label, blinded endpoint trial comparing digoxin and beta-blockers as initial rate control therapy with investigator blinded endpoint. A prospective, randomised, open-label, blinded-endpoint (PROBE) study design.

Number of subjects in period 1	Digoxin	Bisoprolol
Started	81	80
Completed	81	80

Period 2

Period 2 title	6 months follow-up
Is this the baseline period?	No
Allocation method	Randomised - controlled
Blinding used	Single blind
Roles blinded	Investigator ^[2]

Blinding implementation details:

A prospective, randomised, open-label, blinded endpoint trial comparing digoxin and beta-blockers as initial rate control therapy with investigator blinded endpoint. A prospective, randomised, open-label, blinded-endpoint (PROBE) study design.

Arms

Are arms mutually exclusive?	Yes
Arm title	Digoxin
Arm description: -	
Arm type	Active comparator
Investigational medicinal product name	Digoxin Tablets
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Coated tablet
Routes of administration	Oral use

Dosage and administration details:

Trial maintenance doses will initially be 62.5 or 125 µg orally (at the clinician's discretion, taking into account age and renal function), with planned up-titration to 125/250 µg. The maximum trial dose will be 250 µg daily.

A single loading dose of four tablets (250 or 500 µg according to target maintenance dose) will be prescribed in digoxin-naïve participants. The clinician is permitted to omit the loading dose or prescribe a second, where necessary.

Unblinded serum digoxin concentrations will be assessed at visits 2 and 3, with results reported back to the relevant clinician(s). This process will assist in monitoring compliance, adjusting dosage in cases of

low serum levels and avoiding toxicity.

Arm title	Bisoprolol
Arm description: -	
Arm type	Active comparator
Investigational medicinal product name	Bisoprolol
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Film-coated tablet
Routes of administration	Oral use

Dosage and administration details:

Trial starting doses will be 1.25 or 2.5 or 5 mg (at the clinician's discretion), with planned up-titration to 10 mg in increments of 1.25 or 2.5 mg. The maximum trial dose will be 15 mg daily. No loading dose is required.

Notes:

[2] - The roles blinded appear inconsistent with a simple blinded trial.

Justification: Blinding implementation details: A prospective, randomised, open-label, blinded endpoint trial comparing digoxin and beta-blockers as initial rate control therapy with investigator blinded endpoint. A prospective, randomised, open-label, blinded-endpoint (PROBE) study design.

Adverse events

Adverse events information

Timeframe for reporting adverse events:

Targeted AEs reported on the CRF were reportable to the RATE-AF Trial Office up to 30 days post last IMP administration. Any SUSAR related to the IMP was expected to be reported irrespective of how long after IMP administration the reaction has occurred.

Adverse event reporting additional description:

Adverse events (AEs) were recorded in the medical records and CRFs. Most AE/ARs that occurred in the trial, whether they are serious or not, were 'expected' treatment-related toxicities due to the drugs used in this trial.

Assessment type	Non-systematic

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
24 July 2017	Addition of new site.
29 May 2018	* Changes made to protocol. * Changes made to Participant Optional Consent Form. New documents submitted: - Optional Sub Study 'Nerve Activity and Heart Rate' Patient information leaflet. - Optional Sub Study 'Physical Activity and Heart Rate Monitoring' Patient information leaflet.
21 November 2019	Change of Principle Investigator.
13 December 2019	Changes made to protocol.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

None reported.

Notes:
