

## Clinical trial results:

### A Multicenter, Randomized, Double-Blind, Placebo-Controlled, Phase 3 Study to Evaluate the Efficacy and Safety of Satralizumab (SA237) as Monotherapy in Patients With Neuromyelitis Optica (NMO) and Neuromyelitis Optica Spectrum Disorder (NMOSD)

#### Summary

EudraCT number	2015-005431-41
Trial protocol	PL RO HR
Global end of trial date	31 January 2022

#### Results information

Result version number	v2 (current)
This version publication date	20 February 2023
First version publication date	27 September 2020
Version creation reason	

#### Trial information

##### Trial identification

Sponsor protocol code	BN40900
-----------------------	---------

##### Additional study identifiers

ISRCTN number	-
ClinicalTrials.gov id (NCT number)	NCT02073279
WHO universal trial number (UTN)	-

Notes:

#### Sponsors

Sponsor organisation name	Hoffmann-La Roche AG
Sponsor organisation address	Grenzacherstrasse 124, Basel, Switzerland, CH-4070

Notes:

#### Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

## Results analysis stage

Analysis stage	Final
Date of interim/final analysis	31 January 2022
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	31 January 2022
Was the trial ended prematurely?	No

Notes:

## General information about the trial

Main objective of the trial:

The primary objective of this study was to evaluate the efficacy of satralizumab monotherapy compared with placebo in participants with NMO and NMOSD. In addition, safety, pharmacodynamics (PD), pharmacokinetics (PK), and immunogenicity of satralizumab were evaluated.

Protection of trial subjects:

All study participants were required to read and sign an Informed Consent Form.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	05 August 2014
Long term follow-up planned	Yes
Long term follow-up rationale	Safety
Long term follow-up duration	6 Months
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

## Population of trial subjects

### Subjects enrolled per country

Country: Number of subjects enrolled	Bulgaria: 4
Country: Number of subjects enrolled	Canada: 11
Country: Number of subjects enrolled	Georgia: 1
Country: Number of subjects enrolled	Korea, Republic of: 5
Country: Number of subjects enrolled	Malaysia: 1
Country: Number of subjects enrolled	Poland: 8
Country: Number of subjects enrolled	Turkey: 1
Country: Number of subjects enrolled	Taiwan: 4
Country: Number of subjects enrolled	Ukraine: 10
Country: Number of subjects enrolled	United States: 47
Country: Number of subjects enrolled	Croatia: 1
Country: Number of subjects enrolled	Italy: 1
Country: Number of subjects enrolled	Romania: 1
Worldwide total number of subjects	95
EEA total number of subjects	15

Notes:

<b>Subjects enrolled per age group</b>	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	94
From 65 to 84 years	1
85 years and over	0

## Subject disposition

### Recruitment

Recruitment details:

The Double-blind (DB) period lasted up to the primary clinical cut-off date (CCOD: 12 Oct 2018) when the study reached 1.5 years since the date of randomization of the last participant enrolled.

The Open Label Period lasted up to clinical cut-off date (31-Jan-2022).

### Pre-assignment

Screening details:

Participants with neuromyelitis optica (NMO) or NMO spectrum disorder (NMOSD) were randomized 2:1 to receive either satralizumab 120 mg or matching placebo.

### Period 1

Period 1 title	Double-blind Period
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Monitor, Carer, Data analyst, Assessor

### Arms

Are arms mutually exclusive?	Yes
<b>Arm title</b>	Placebo, then Satralizumab

Arm description:

Participants received matching placebo, subcutaneous (SC) injection at Weeks 0, 2 and 4, and every 4 weeks (Q4W) thereafter throughout the double-blind (DB) period up to protocol-defined relapse. Following the DB period, all participants received satralizumab 120 mg SC injection at Weeks 0, 2 and 4, and Q4W thereafter up to the clinical cut-off date (CCOD). At the CCOD, participants who had not experienced a relapse during the DB period were invited to initiate satralizumab 120 mg SC injection (at Weeks 0, 2 and 4, and Q4W thereafter) after 4 weeks from their last study treatment dose in the DB period.

Arm type	Placebo
Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection
Routes of administration	Subcutaneous use

Dosage and administration details:

Placebo was administered subcutaneously (SC) at Weeks 0, 2, and 4, and thereafter once every 4 weeks.

<b>Arm title</b>	Satralizumab, then Satralizumab
------------------	---------------------------------

Arm description:

Participants received satralizumab 120 mg subcutaneous (SC) injection at Weeks 0, 2 and 4, and every 4 weeks (Q4W) thereafter throughout the double-blind (DB) period. Participants who experienced a protocol defined relapse could continue in the Open Label Extension (OLE) period 31 days after relapse. Participants who completed the DB period without relapse could participate in the OLE period 4 weeks after receiving their last dose in the DB period. All OLE participants received satralizumab 120 mg SC injection at Weeks 0, 2 and 4, and Q4W thereafter.

Arm type	Experimental
Investigational medicinal product name	Satralizumab
Investigational medicinal product code	
Other name	SA237
Pharmaceutical forms	Solution for injection
Routes of administration	Subcutaneous use

Dosage and administration details:

Satralizumab was administered SC at Weeks 0, 2, and 4, and thereafter once every 4 weeks.

Number of subjects in period 1	Placebo, then Satralizumab	Satralizumab, then Satralizumab
Started	32	63
Completed	28	56
Not completed	4	7
Consent withdrawn by subject	2	2
Adverse event, non-fatal	1	1
Ongoing in study	1	2
Switched to another treatment	-	1
Protocol deviation	-	1

## Period 2

Period 2 title	Open-label Extension Period
Is this the baseline period?	No
Allocation method	Not applicable
Blinding used	Not blinded

## Arms

Are arms mutually exclusive?	Yes
<b>Arm title</b>	Placebo, then Satralizumab

### Arm description:

Participants received matching placebo, subcutaneous (SC) injection at Weeks 0, 2 and 4, and every 4 weeks (Q4W) thereafter throughout the double-blind (DB) period up to protocol-defined relapse. Following the DB period, all participants received satralizumab 120 mg SC injection at Weeks 0, 2 and 4, and Q4W thereafter up to the clinical cut-off date (CCOD). At the CCOD, participants who had not experienced a relapse during the DB period were invited to initiate satralizumab 120 mg SC injection (at Weeks 0, 2 and 4, and Q4W thereafter) after 4 weeks from their last study treatment dose in the DB period.

Arm type	Placebo
Investigational medicinal product name	Satralizumab
Investigational medicinal product code	
Other name	SA237
Pharmaceutical forms	Solution for injection
Routes of administration	Subcutaneous use

### Dosage and administration details:

Satralizumab was administered SC at Weeks 0, 2, and 4, and thereafter once every 4 weeks.

<b>Arm title</b>	Satralizumab, then Satralizumab
------------------	---------------------------------

### Arm description:

Participants received satralizumab 120 mg subcutaneous (SC) injection at Weeks 0, 2 and 4, and every 4 weeks (Q4W) thereafter throughout the double-blind (DB) period. Participants who experienced a protocol defined relapse could continue in the Open Label Extension (OLE) period 31 days after relapse. Participants who completed the DB period without relapse could participate in the OLE period 4 weeks after receiving their last dose in the DB period. All OLE participants received satralizumab 120 mg SC injection at Weeks 0, 2 and 4, and Q4W thereafter.

### Primary: Time to First Protocol-Defined Relapse (TFR) in the Double-Blind (DB) Period

End point title	Time to First Protocol-Defined Relapse (TFR) in the Double-Blind (DB) Period
End point description: TFR is time from randomization to first occurrence of relapse in the DB period. Protocol-defined relapse was occurrence of new/worsening neurological symptoms attributable to NMO/NMOSD. Symptoms persisted for >24 hours and not attributable to confounding clinical factors (e.g., fever, infection, injury, change in mood, adverse reactions to medications). New/worsening neurological symptoms that occurred < 31 days following onset of a protocol-defined relapse were considered part of same relapse (2 relapses with onset days in 30 days of one another was counted as 1 relapse), onset date used in analysis was the date of first relapse. Intent-to-treat (ITT) population: all randomized participants. 999999=upper limit of CI was not reached due to low number of participants with events. 99999=median was not reached due to low number of participants with events.	
End point type	Primary

## Secondary: Change in Visual Analogue Scale (VAS) for Pain from Baseline to Week 24

<b>End point title</b>	Change in Visual Analogue Scale (VAS) for Pain from Baseline to Week 24
End point description:	
<p>The VAS is a subjective measure of pain consisting of a 100 mm line with two endpoints representing 0 = "no pain" and 100 = "pain as bad as it could be". Participants rated their pain by placing a mark on the line corresponding to their current level of pain. The distance along the line from the "no pain" marker was measured with a ruler giving a pain score out of 100. A higher score indicated more pain and lower scores reflected a better health state. A negative change from baseline indicates an improvement. ANCOVA was used for analysis to report the adjusted mean and standard error (SE). ITT population included all participants randomized to the treatment groups. Missing data were imputed by BOCF method.</p>

## Secondary: Change in Functional Assessment of Chronic Illness Therapy (FACIT) Fatigue Scale from Baseline to Week 24

End point title	Change in Functional Assessment of Chronic Illness Therapy (FACIT) Fatigue Scale from Baseline to Week 24
-----------------	---

End point description:

The FACIT Fatigue scale is a 13-item questionnaire that assesses self-reported fatigue and its impact upon daily activities and function over the past 7 days. As each of the 13 items of the scale ranges from 0-4, the range of possible scores was computed using FACIT scoring algorithm as 0-52, where 0 is the worst possible score and 52 the best which indicated less fatigue. A positive change from baseline indicates an improvement. ITT population included all participants randomized to the treatment groups. Missing data were imputed by BOCF method.

### Secondary: Change from Baseline in SF-36 Mental Health Domain Scores at 24 Week Intervals During the DB Period

End point title	Change from Baseline in SF-36 Mental Health Domain Scores at 24 Week Intervals During the DB Period
-----------------	---

End point description:

The SF-36v2 is a multi-purpose, short form health survey with 36 questions. It has 8 domains (vitality, physical functioning, bodily pain, general health, role-physical, role emotional, social role functioning and mental health) of functional health and well-being scores as well as psychometrically based physical and mental health component summary measures and a preference-based health utility index. The domain scores were transformed to a 0-100 scale, where higher scores indicate better quality of life. A positive change from baseline indicates an improvement. ITT population included all participants randomized to the treatment groups. 9999=SD was not calculable for 1 participant. 6666=0 participants.

## Secondary: Change from Baseline in Visual Function (Low-Contrast Sloan Letter Chart [LCSLC]) Scores at 24 Week Intervals During the DB Period

End point title	Change from Baseline in Visual Function (Low-Contrast Sloan Letter Chart [LCSLC]) Scores at 24 Week Intervals During the DB Period
-----------------	--

End point description:

The LCSLC evaluates the visual function and captures the minimum size at which individuals can perceive letters of a particular contrast level. The change in binocular visual acuity, as assessed by the number of letters read correctly from a distance of 2 meters on 100%, 2.5% and 1.25% contrast level Sloan letter charts, was analyzed. The LCSLC is scored on a scale of 0-60. Higher scores indicate better visual function. A positive change from baseline indicates an improvement. ITT population included all participants randomized to the treatment groups. 9999=SD was not calculable for 1 participant. 6666=0 participants.

## Secondary: Number of Participants with at Least One Adverse Event in the Double-Blind Period

End point title	Number of Participants with at Least One Adverse Event in the Double-Blind Period
End point description:	
An adverse event is any untoward medical occurrence in a participant administered a pharmaceutical product and which does not necessarily have to have a causal relationship with the treatment. An adverse event can therefore be any unfavorable and unintended sign (including an abnormal laboratory finding, for example), symptom, or disease temporally associated with the use of a pharmaceutical product, whether or not considered related to the pharmaceutical product. Pre-existing conditions which worsen during a study are also considered as adverse events. The Safety Analysis Population (SAF) included all randomized participants who had received at least 1 dose of satralizumab or placebo.	
End point type	Secondary

### Secondary: Number of Participants With Suicidal Behaviors and Ideations Collected by Columbia-Suicide Severity Rating Scale in the Double-Blind Period

End point title	Number of Participants With Suicidal Behaviors and Ideations Collected by Columbia-Suicide Severity Rating Scale in the Double-Blind Period
-----------------	---

End point description:

The Columbia-Suicide Severity Rating Scale (C-SSRS) is an assessment tool to evaluate suicidal ideation and behavior. Categories have binary responses (yes/no) and include: Wish to be Dead; Non-specific Active Suicidal Thoughts; Active Suicidal Ideation with Any Methods (Not Plan) without Intent to Act; Active Suicidal Ideation with Some Intent to Act, without Specific Plan; Active Suicidal Ideation with Specific Plan and Intent, Preparatory Acts and Behavior; Aborted Attempt; Interrupted Attempt; Actual Attempt (non-fatal); Completed Suicide. Suicidal ideation or behavior is indicated by a "yes" answer to any of the listed categories. A score of 0 is assigned if no suicide risk is present. A score of 1 or higher indicates suicidal ideation or behavior. The SAF included all randomized participants who had received at least 1 dose of satralizumab or placebo.

End point title	Serum Satralizumab Concentration During the DB Period <sup>[3]</sup>
-----------------	--

End point description:

The SAF included all randomized participants who had received at least 1 dose of satralizumab or placebo. Participants from SAF who received satralizumab were evaluated for this endpoint. 9999=SD was not calculable for 1 participant.

End point type	Secondary
----------------	-----------

End point timeframe:

Baseline, Weeks 2, 4, 5, 6, 8, and every 4 weeks thereafter up to Week 204

Notes:

[3] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period. Justification: Reported here is the percentage of participants with at least one positive anti-drug antibody measurement during the DB period. The SAF included all randomized participants who had received at least 1 dose of satralizumab or placebo. Participants from SAF who received satralizumab were evaluated for this endpoint. Data was summarized together for this endpoint.

## Statistical analyses

No statistical analyses for this end point

## Secondary: Percentage of Participants with Anti-Drug Antibodies to Satralizumab in

## the DB Period

End point title	Percentage of Participants with Anti-Drug Antibodies to Satralizumab in the DB Period <sup>[4]</sup>
-----------------	--

End point description:

Reported here is the percentage of participants with at least one positive anti-drug antibody measurement during the DB period. The SAF included all randomized participants who had received at least 1 dose of satralizumab or placebo. Participants from SAF who received satralizumab were evaluated for this endpoint. Data was summarized together for this endpoint.

End point type	Secondary
----------------	-----------

End point timeframe:

Up to Week 216

Notes:

[4] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period.

Justification: Reported here is the percentage of participants with at least one positive anti-drug antibody measurement during the DB period. The SAF included all randomized participants who had received at least 1 dose of satralizumab or placebo. Participants from SAF who received satralizumab were evaluated for this endpoint. Data was summarized together for this endpoint.

<b>End point values</b>	Satralizumab, then Satralizumab			
Subject group type	Reporting group			
Number of subjects analysed	63			
Units: percentage of participants				
number (not applicable)	71.4			

## Statistical analyses

## Adverse events

### Adverse events information

Timeframe for reporting adverse events:

Double Blind Period:

Up to primary clinical cut-off date, 12 Oct 2018 (up to approximately 217 weeks)

Open Label Period:

Up to primary clinical cut-off date, 31-Jan-2022 (up to approximately 336 weeks)

Assessment type	Systematic
-----------------	------------

### Dictionary used

Dictionary name	MedDRA
Dictionary version	24.1

### Reporting groups

Reporting group title	Placebo Double Blind Period
-----------------------	-----------------------------

Reporting group description:

Participants received matching placebo, subcutaneous (SC) injection at Weeks 0, 2 and 4, and every 4 weeks (Q4W) thereafter throughout the double-blind (DB) period. Participants who experienced a protocol defined relapse could continue in the Open Label Extension (OLE) period 31 days after relapse. Participants who completed the DB period without relapse could participate in the OLE period 4 weeks after receiving their last dose in the DB period.

Reporting group title	SA237 Double Blind Period
-----------------------	---------------------------

Reporting group description:

Participants received satralizumab 120 mg subcutaneous (SC) injection at Weeks 0, 2 and 4, and every 4 weeks (Q4W) thereafter throughout the double-blind (DB) period. Participants who experienced a protocol defined relapse could continue in the Open Label Extension (OLE) period 31 days after relapse. Participants who completed the DB period without relapse could participate in the OLE period 4 weeks after receiving their last dose in the DB period.

Reporting group title	Placebo Open Label Period
-----------------------	---------------------------

Reporting group description:

Participants received matching placebo, subcutaneous (SC) injection at Weeks 0, 2 and 4, and every 4 weeks (Q4W) thereafter throughout the double-blind (DB) period. Following the DB period, all participants received satralizumab 120 mg SC injection at Weeks 0, 2 and 4, and Q4W thereafter up to the clinical cut-off date (CCOD).

Reporting group title	SA237 Open Label Period
-----------------------	-------------------------

Reporting group description:

Participants received satralizumab 120 mg subcutaneous (SC) injection at Weeks 0, 2 and 4, and every 4 weeks (Q4W) thereafter throughout the double-blind (DB) period. Following the DB period, all participants received satralizumab 120 mg SC injection at Weeks 0, 2 and 4, and Q4W thereafter up to the clinical cut-off date (CCOD).

## More information

### Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
18 February 2014	V2: Study design: The randomization was stratified by prior therapy for prevention of NMO/NMOSD attack (B-cell depleting therapy or immunosuppressants/others) and the most recent attack in the last one year prior to screening (first attack or relapse). Exclusion criteria: History of drug or alcohol abuse within 1 year prior to baseline; History of acute diverticulitis that, in the Investigator's opinion, may lead to increased risk of complications such as lower gastrointestinal perforation. Screening for possible relapse during the study: A Relapse Assessment Form, including the time and content of every report of a possible event was prepared. Patients were instructed to remember accurately the time and content of every symptom of a possible relapse and to contact the study site if they had such symptoms. During the double-blind period, the site contacted the patient weekly by phone calls between the scheduled site visits, to query for any change in symptoms or other signs of a potential relapse. Assessment for suicidality was added to the safety section (Columbia-Suicide Severity Rating Scale [C-SSRS]). The number of patients who are negative for anti-AQP4 antibody at screening were limited to approximately 30% of total study population.
26 May 2014	V3: Change in protocol-defined relapse: new or worsening neurologic symptoms had to meet any of the listed symptoms. Futility analysis was removed from the role of the independent data monitoring committee (IDMC). Hypersensitivity to gadolinium was removed from the exclusion criteria. Additional procedure was added for scripted questions at patient discontinuation to minimize dropout and not to miss potential relapse. Time limit for participants to report relapse event was set. Beginning time point of TFR was modified to start at randomization. Considering the clinical practice in the US, the permitted treatment for relapse was modified. For general safety patients who had a risk of Stevens-Johnson syndrome (SJS) were excluded from the study.
02 September 2014	V4: Protocol-defined relapse criteria were updated to specify the score increase required to qualify as clinically meaningful for the Expanded Disability Status Scale (EDSS) and Functional System Score (FSS) when the baseline score is zero. Instructions for tuberculosis screening and treatment were updated.
05 November 2015	V5: The right to enter the extension period was modified in that protocol-defined relapse had to be adjudicated by the Clinical Endpoint Committee (CEC) in the double-blind Period. The open-label extension period was extended until commercial availability of the drug. Statistical method for primary analysis was changed to a log-rank based permutation test. Clarification was provided to mention that participants who experienced a relapse during the extension period could continue administration of satralizumab at the discretion of the Investigator. Screening procedure for hepatitis C virus (HCV) was modified to mention that if a patient tested positive, but ribonucleic acid (RNA) was undetectable 12 weeks after HCV treatment completion, the patient could be enrolled. Assessments performed at the Withdrawal visit were provided separately for the double-blind period and extension period. Assessments after Week 48 of the extension period were included, because the open-label extension period was extended until commercial availability.
01 March 2016	V6: Recruitment was changed from North America only to include the rest of the world. Total number of participants in the study was increased to 90. The total number of relapse events was changed because the hazard ratio assumption of satralizumab over placebo was modified. The end of the double-blind period was then defined as the date of primary analysis when the total number of relapses reached 44. Procedure for triplicate ECG was clarified for participants who consented to additional pharmacokinetic (PK) sampling.

13 July 2017	V7: Satralizumab prefilled syringe (PFS) with needle safety device (NSD) was implemented in the study. The number of participants to collect blood sample for plasmablast was expanded to all participants. Clarification was included that Zarit Burden Interview (ZBI) was optional and would be performed in selected countries for caregivers who signed informed consent to caregiver burden assessment.
14 June 2018	V8: To prevent prolonged exposure to an unknown risk-benefit balance drug, the definition of the end of the double-blind period was changed to include a maximal duration completion of 1.5 years after the date of the last participant randomized, if the target number of protocol-defined relapses (PDRs) adjudicated by Clinical Endpoint Committee (CEC) had not been reached. The analysis method for primary endpoint was changed to a stratified two-sided log-rank test using strata of prior therapy for prevention of NMO/NMOSD attack (B-cell depleting therapy or immunosuppressants/others) and the most recent attack in the last one year prior to screening (first attack or relapse). Statistical methods were clarified for VAS in pain score and FACIT fatigue scale score to be ANCOVA with hot-deck imputation. It was clarified that non-linear mixed-effects modeling would be used to analyze the sparse sampling dose-concentration-time data of satralizumab.

Notes:

---

## Interruptions (globally)

Were there any global interruptions to the trial? No

## Limitations and caveats

None reported
